Lake Merwin and Swift Creek Reservoir Tributaries

Bull Trout Limiting Factors Analysis
Study Objectives – Answer Key ?’s

- Do other tributaries to Swift Creek Reservoir and Lake Merwin not known to support bull trout have suitable spawning, incubation, rearing habitat?
- Do bull trout currently inhabit these streams?
- If no suitable habitat, what are limiting factors?
- Could limiting factors be addressed by restoration to promote long-term spawning, incubation, and rearing?
Address Key Information Gaps Identified in the Draft Recovery Plan

- Identify other potential tributaries that could support a local population (Priority 1 Action)
- Increased inventory in each basin to establish current distribution
- Complete LFA for “other potential sites within the Lewis Core Area which have, or could support suitable habitat conditions if restored”
Study Approach

- Review existing information
- Initially rate streams as Optimal, Marginal, Poor, or Unknown for bull trout habitat, drop streams rated as Poor
- Collect field data to fill information gaps, rate streams as data is acquired
- Conduct Presence/Absence Survey of Optimal and Marginal streams
- Habitat survey Optimal and Marginal streams
- Perform Qualitative Habitat Assessment of Optimal and Marginal streams and identify limiting factors
- Recommend actions to address limiting factors
Study Area

- **Lake Merwin Tributaries:** Cape Horn, Jim, Indian George, Buncombe Hollow, M4, Brooks, M14, Marble, Rock, Canyon creeks

- **Swift Creek Reservoir Tributaries:** Swift, Range, S10, Drift, S15, and Diamond creeks
## Initial Rating Criteria

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Optimal</th>
<th>Marginal</th>
<th>Poor</th>
<th>Unknown</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow</td>
<td>Perennial</td>
<td>Perennial</td>
<td>Seasonal</td>
<td>Observations of late summer flow do not exist</td>
</tr>
<tr>
<td>Gradient</td>
<td>≤12%</td>
<td>&lt;20%</td>
<td>≥20%</td>
<td>Unknown barrier presence</td>
</tr>
<tr>
<td>Maximum water temperature (summer rearing)</td>
<td>≤16°C</td>
<td>≤18°C</td>
<td>&gt;18°C</td>
<td>Continuous water temperature data through the summer do not exist</td>
</tr>
<tr>
<td>Maximum Water temperature (spawning) by mid-November</td>
<td>≤10°</td>
<td>≤13°</td>
<td>&gt;13°C</td>
<td>Continuous water temperature data through the fall do not exist</td>
</tr>
</tbody>
</table>
Initial Rating

- Marble, Canyon, Rock, and Diamond rated Poor (high gradient, low flow, low elevation, barrier presence)
- The other 12 streams rated as Unknown for water temperature
- Water temperature data was collected to rate the 12 streams for spawning and rearing potential
Water Temperature Methods

- Temperature logger at stream mouth for all 12 streams
- Second logger located in upper portion of accessible reach for streams with >1 mile of habitat
- Cold water refugia survey of all 12 streams (requested by USFWS)
Temperature Results

- 8 streams had max. temp. >18°C (Poor rearing)
- Drift and Brooks <18°C (Marginal rearing)
- Swift and S10 <12°C (Optimal rearing)
- No cold water refugia in streams rated as Poor
- By Sept. 1 Swift <10°C (Optimal spawning)
- By mid-Sept. S10 <10°C (Optimal spawning)
- By mid-Sept. Brooks <13°C, Drift <11.5°C (Marginal spawning)
Presence/Absence Survey

- Surveyed streams with Optimal/Marginal rearing temperatures (Swift, S10, Brooks, Drift)
- Also surveyed streams with max. temp. slightly >18°C to verify criteria (Range, Indian G., Jim)
- Found bull trout in Swift Creek (the only stream rated Optimal for spawning/rearing by Sept. 1)
- Low Flow limited access to S10, Brooks Creek
- One unidentified redd in Drift Creek (3 x 6 ft)
Swift Creek Bull Trout

- Observed 5 bull trout (400 – 600 mm) on August 31 up to 800 feet upstream of mouth.
- Turbidity increased following rains during Sept. (week 1) limiting snorkel surveys there after.
- Electrofished margin habitat in Sept., found only whitefish, sculpin, rainbow trout juveniles.
- Three additional bull trout (400 – 600 mm) observed on subsequent survey attempts.
Swift Creek
below 5-ft falls
Swift Creek upstream of 5-ft falls
Low Flow mid-Sept.

S10 Creek

Brooks Creek
Habitat Surveys

- Initially scheduled for late-September to early-October for Optimal and Marginal streams

- Due to low flow and lack of bull trout observations in September, postponed habitat surveys until 1st week in November (potential latter part of spawning period) when flows might be higher to allow passage upstream
November Flood

- Occurred during 1\textsuperscript{st} week of November when habitat surveys were scheduled to begin
- Caused major habitat alterations in many tributaries
- Boulders >4 ft in diameter moved in Range Cr., massive bank scour and >100 trees fell into S10, \( \approx 8 - 10 \) ft of bedload deposited at Swift Creek logger site
- Lost most thermographs
Brooks Creek early-December
S10 Creek

New barrier formed by massive scour ≈ 350 ft downstream of previous barrier
Habitat Survey Re-Schedule

- Flows dropped in early-December
- Completed habitat survey of S10 and Brooks Cr.
- Since then, high flow or low reservoir levels (precluding a boat launch) have postponed habitat surveys for Swift and Drift Cr.
- Swift and Drift will be surveyed as soon as conditions permit
Future Work

- Complete habitat survey of Swift and Drift Cr.
- Conduct QHA habitat rating meeting with agencies (USFWS, WDFW)
- Conduct assessment of limiting factors and potential habitat restoration alternatives
- Finalize draft report
- Submit final draft report for ACC review
Participants

- Frank Shrier (PacifiCorp)
- Eric Lesko (PacifiCorp)
- Jeremiah Doyle (CH₂MHill)
- Jason Shappart (MEI)
- George Gilmour (MEI)
- Kevin Malone (Mobrand/J&S)
- Jim Byrne (WDFW)
- LouEllyn Jones (USFWS)
- Shelly Spalding (USFWS)
- Joe Hiss (USFWS)
- Jeff Chan (USFWS)
