APPENDICES

Acronyms and Abbreviations

AGRE	quackgrass (*Elymus* [syn. *Agropyron*] *repens*)
BMPs	best management practices
CAPY	Italian plumeless thistle (*Carduus pycnocephalus*)
CEDI	diffuse knapweed (*Centaurea diffusa*)
CEMA	spotted knapweed (*Centaurea stoebe* [syn. *maculosa*])
CEPR	meadow knapweed (*Centaurea debeauxii* [syn. *pratensis*])
CESO	yellow starthistle (*Centaurea solstitialis*)
CHJU	rush skeletonweed (*Chondrilla juncea*)
CIAR	Canada thistle (*Cirsium arvense*)
CIVU	bull thistle (*Cirsium vulgare*)
CRMO	English hawthorn (*Crataegus monogyna*)
CYSC	Scotch broom (*Cytisus scoparius*)
FERC	Federal Energy Regulatory Commission
GIS	geographic information system
GPS	Global Positioning System
HEHE	English ivy (*Hedera helix*)
HYPE	St. John's wort (*Hypericum perforatum*)
ILAQ	English holly (*Ilex aquifolium*)
LIVU	yellow toadflax (*Linaria vulgaris*)
Msl	mean sea level
NC	no change
NO	2012 infestation with no observed plants in 2015 or infestation included in BLM or USFS treatment data that was not observed during the 2015 survey
ODA	Oregon Department of Agriculture
PHAR	reed canarygrass (*Phalaris arundinacea*)
PORE	sulfur cinquefoil (*Potentilla recta*)
POSA	giant knotweed (*Polygonum sachalinense*)
Project	North Umpqua Hydroelectric Project
QA/QC	quality assurance/quality control
ROW	right-of-way
RUDI	Himalayan blackberry (*Rubus armeniacus* [syn. *discolor*])
SA	Settlement Agreement
SEJA	tansy ragwort (*Senecio jacobaea*)
TACA	medusahead rye (*Taeniatherum caput-medusae*)
UNF	Umpqua National Forest
USFS	United States Department of Agriculture Forest Service
BLM	United States Department of the Interior Bureau of Land Management
VMP	Vegetation Management Plan

1.0 Introduction

1.1 Background

PacifiCorp owns and operates the North Umpqua Hydroelectric Project (Project), which was first licensed by the Federal Energy Regulatory Commission (FERC) in 1947 (FERC 2003). The Project (FERC No. 1927) is located in Douglas County, Oregon, east of the city of Roseburg. The Project encompasses more than 3,000 acres of the North Umpqua River watershed, spanning from the Dixonville Substation in the west to Lemolo Lake in the east. The Project consists of access easements and unimproved road right-of-way (ROW), transmission line corridors, substations, administrative and PacifiCorp housing facilities, riparian areas and shorelines, and hydroelectric facilities (e.g., impoundments and canals) that occur within a FERC-designated Project boundary. These Project elements are located primarily within the Umpqua National Forest (UNF), which is managed by the United States Department of Agriculture Forest Service (USFS). Portions of transmission line corridors cross lands managed by the United States Department of the Interior Bureau of Land Management (BLM), as well as privately owned lands. The USFS and BLM, along with PacifiCorp, have a shared responsibility to manage resources within the Project boundary area, including the prevention and control of noxious weed species.

Noxious weeds are non-native plants that are especially undesirable because they cause economic loss and harm to the environment (ODA 2012). Noxious weeds can adversely affect the structure and diversity of native plant communities, thereby affecting wildlife habitat, aesthetic values, and the overall functional integrity of ecosystems. As used in this report, the term “noxious weeds” includes weeds defined as noxious by the Oregon Department of Agriculture (ODA) and undesirable invasive plant species.

In recent years, the prevention and control of noxious weeds have become significant resource management issues on federal lands. The USFS and BLM are required to prevent and control the spread of undesirable invasive plants, including noxious weeds, on lands under their management by implementing integrated weed management programs. PacifiCorp coordinates with the USFS and BLM for noxious weed management within the Project boundary.

PacifiCorp’s primary guidance document for the prevention and control of noxious weeds is their Vegetation Management Plan (VMP; PacifiCorp and EDAW 2004). On November 18, 2003, the FERC issued PacifiCorp a new 35-year license to operate the North Umpqua hydroelectric facilities. The License Order was based on the terms and conditions of the North Umpqua Project Settlement Agreement (SA) (June 13, 2001) among PacifiCorp, USFS, BLM, and other stakeholders. Section 12.1 of the SA required the development of a VMP that includes measures

to limit the establishment and spread of noxious weeds in the Project boundary (PacifiCorp and EDAW 2004). PacifiCorp is required to control and prevent the spread of noxious weeds for the life of the license.

A key component of the VMP is the initial noxious weed inventory, followed by periodic inventories every three years. PacifiCorp completed the initial inventory in 2003 and periodic inventories in 2006 (PacifiCorp 2007), 2009 (PacifiCorp 2010), and 2012 (PacifiCorp 2012).

This 2015 noxious weed inventory surveyed and assessed terrestrial weeds only. An aquatic weed inventory was not conducted in 2015. Since aquatic noxious weeds were not found during the previous aquatic invasive species survey conducted in 2012 (PacifiCorp 2012), the USFS indicated that aquatic noxious weed surveys were not required for 2015 (meeting notes in VMP 5-year Rolling Action Plan Calendar Year 2015). The next aquatic noxious weed survey would be conducted during the periodic inventory in 2018.

1.2 Objectives

The objectives of the 2015 noxious weed inventory are to identify and survey new and existing noxious weed infestations within the Project boundary, as specified in the VMP. In addition to the field survey, updates to the geographic information system (GIS) noxious weed database and maps are included. This report compares results from previous inventories (Sections 3.1 and 4.1) and describes existing conditions for future analysis of terrestrial noxious weed populations.

1.3 Inventory Area

The inventory area for the 2015 terrestrial noxious weed inventory includes only USFS and BLM lands within the Project boundary. USFS and BLM lands constitute 95% and 5% of the inventory area, respectively. The noxious weed inventory area as designated in the VMP does not include privately owned lands.

The inventory area includes a range of elevations, slopes, and aspects, all of which affect the establishment success and prevalence of different noxious weed species. Elevations range from approximately 850 feet above mean sea level (msl) in the western portion (downstream extent) to over 4,400 feet above msl in the eastern portion near Lemolo Lake at the upstream extent of the Project. Slopes within the western inventory area are steep, with inner gorge slopes of 60–70% and valley slopes of 40–60%. The facilities along the North Umpqua River channel, canals, and road portions of the inventory area have more gentle slopes, generally less than 40%.

The inventory area is divided into 11 Project sections to categorize noxious weed data by location and to allow comparison to previous inventories (Table 1-1). The Project sections were updated in 2015 to match the current 2015 FERC Project boundary. Almost 50% of the inventory area occurs in two major areas: Lemolo 1 Powerhouse to Lemolo Lake, including associated

campgrounds, and Transmission Line West of Toketee Switching Station Project section. An additional 20% of the inventory is within the Clearwater Facilities and Lemolo 2 Forebay/Canal Project sections. The other seven Project sections make up the remaining 30% of the inventory area (Table 1-1).

Table 1–1. Noxious weed inventory Project sections and proportions of inventory areas.

Project Section	Description	Proportion of Inventory Area
Lemolo 1 Powerhouse to Lemolo Lake	Lemolo 1 Powerhouse and Canal and Lemolo Lake, including associated campgrounds and access roads (689 acres)	26.4%
Transmission Line West of Toketee Switching Station	ROW for transmission lines 39, 42, 46, and associated access roads on USFS land (593 acres)	22.7%
Clearwater Facilities	Stump Lake and Clearwater 1 Canal, Forebay, Penstock, and Powerhouse; Clearwater 2 Diversion Dam, Canal, Forebay, and Penstock to Toketee Lake Facilities; and all associated access roads (268 acres)	10.3%
Lemolo 2 Forebay/Canal	Lemolo 2 Forebay, Canal, various diversions, and associated access roads (262 acres)	10.0%
Toketee Lake Facilities	Toketee Lake, Boneyard, Maintenance Yard, Bunkhouse/Cookhouse, Toketee Campground, Clearwater Villages, Clearwater 2 Powerhouse, Clearwater Reconnect, and associated access roads (186 acres)	7.1%
Transmission Line between Lemolo Powerhouses	Transmission line 53 ROW between Lemolo 1 and 2 Powerhouses and associated access roads (139 acres)	5.3%
Transmission Line BLM Ownership	ROW for transmission lines 39 and 46 and associated access roads on BLM land (128 acres)	4.9%
Slide/Soda Facilities	Soda Springs Powerhouse, Soda Springs Reservoir, Slide Creek Canal, and Slide Creek Facilities, and associated access roads (119 acres)	4.6%
Fish Creek Facilities	Fish Creek Forebay, Penstock, Canal, Diversion Dam; Fish Creek Powerhouse; and associated access roads (103 acres)	3.9%
Transmission Line between Toketee Switching Station and Lemolo 2 Powerhouse	ROW for transmission lines 51, 53, 55, and associated access roads between Toketee Switching Station and Lemolo 2 Powerhouse and associated access roads (64 acres)	2.4%
Clearwater Transmission Line	Transmission line 57 ROW between Clearwater 1 and 2 Powerhouses and associated access roads (62 acres)	2.4%

2.0 Methodology

The 2015 Noxious Weed Inventory was conducted by AECOM botanist Rich Dwerlkotte and ecologist Brian Fletcher. Mr. Dwerlkotte conducted noxious weed inventories within the Project FERC boundary in 2003, 2006, and 2012. The 2015 inventory included the following tasks: pre-field review, terrestrial weed inventory, mapping and database updates, and preparation of this inventory report. Methods for each of these tasks are described below.

2.1 Pre-Field Review

The 2015 Noxious Weed Inventory focused on a list of target weed species known or suspected to occur within the vicinity of the Project (Table 2–1). This list and the associated ratings (Appendix A, Tables A-1 to A-5) were developed by PacifiCorp in cooperation with the BLM and USFS. This target list was updated prior to conducting fieldwork for the 2015 inventory per consultations with the USFS and BLM to include English holly (*Ilex aquifolium*), English hawthorn (*Crataegus monogyna*), and yellow floating heart (*Nymphoides peltata*).

Target species were separated into three categories (high priority, moderate priority, and low priority) to guide data collection protocol (see Section 2.2). Species priority is based on a combination of existing rating systems from the ODA and stakeholder management goals and objectives (PacifiCorp et al. 2001). The pre-field work also included a review of previous inventories (2003, 2006, 2009, and 2012) and noxious weed treatment records obtained from the BLM (Johanna Blanchard, Roseburg District Botanist, July 21, 2015) and USFS (Bryan Benz, UNF Botanist, July 17, 2015).

Updated field maps were used for navigation and to indicate historical occurrences of noxious weeds on USFS and BLM lands in the Project boundary. In addition to the field maps, a data dictionary was developed using ArcPad software installed on Trimble Global Positioning System (GPS) units, similar to the one developed by PacifiCorp in 2009 and 2012. This approach maintained efficient and spatially accurate electronic data collection and integration with existing GIS layers.

Table 2–1. Noxious weed species known or suspected to occur within the Project vicinity.

Common Name[1]	Scientific Name	Priority[2]	ODA Rating[3]
Diffuse knapweed	*Centaurea diffusa*	High	B
English ivy	*Hedera helix*	High	B
French broom	*Genista monspessulana*	High	B
Giant knotweed	***Polygonum sachalinense***	High	B
Gorse	*Ulex europaeus*	High	B,T
Himalayan blackberry	***Rubus armeniacus* (syn. *discolor*)**	**High**	**B**
Hydrilla (waterthyme; aquatic)	*Hydrilla verticillata*	High	A
Italian plumeless thistle	*Carduus pycnocephalus*	High	B
Japanese knotweed	*Polygonum cuspidatum*	High	B
Portuguese (striated) broom	*Cytisus striatus*	High	B,T
Rush skeletonweed	*Chondrilla juncea*	High	B,T
Scotch broom	***Cytisus scoparius***	**High**	**B**
Slender false brome	*Brachypodium sylvaticum*	High	B
Spanish broom	*Spartium junceum*	High	B
Spotted knapweed	***Centaurea stoebe* (syn. *maculosa*)**	**High**	**B,T**
Sulfur cinquefoil	***Potentilla recta***	**High**	**B**
Yellow floating heart	*Nymphoides peltata*	High	A
Yellow starthistle	*Centaurea solstitialis*	High	B,T
Yellow toadflax (butter and eggs)	***Linaria vulgaris***	**High**	**B**
Biddy-biddy	*Acaena novae-zelandiae*	Moderate	B
Blessed milkthistle	*Silybum marianum*	Moderate	B
Canada thistle	***Cirsium arvense***	**Moderate**	**B**
Dalmatian toadflax	*Linaria dalmatica* ssp. *dalmatica*	Moderate	B
Houndstongue (Gypsy flower)	*Cynoglossum officinale*	Moderate	B
Meadow knapweed	***Centaurea debeauxii* (syn. *pratensis*)**	**Moderate**	**B**
Medusahead rye	***Taeniatherum caput-medusae***	**Moderate**	**B**
Orange hawkweed	*Hieracium aurantiacum*	Moderate	A
Paterson's curse (salvation Jane)	*Echium plantagineum*	Moderate	A,T
Puncturevine	*Tribulus terrestris*	Moderate	B
Purple loosestrife	*Lythrum salicaria*	Moderate	B
Quackgrass	***Elymus* (syn. *Agropyron*) *repens***	**Moderate**	**B**
Russian knapweed (hardheads)	*Acroptilon* (syn. *Centaurea*) *repens*	Moderate	B
Spiny cocklebur	*Xanthium spinosum*	Moderate	B
Tansy ragwort (stinking Willie)	***Senecio jacobaea***	**Moderate**	**B,T**
Wooly distaff thistle	*Carthamus lanatus*	Moderate	A,T
Yellow nutsedge	*Cyperus esculentus*	Moderate	B
Bull thistle	***Cirsium vulgare***	**Lowest**	**B**
Eurasian watermilfoil (aquatic)	*Myriophyllum spicatum*	Lowest	B
St. John's wort	***Hypericum perforatum***	**Lowest**	**B**
Reed canarygrass	***Phalaris arundinacea***	**N/A[4]**	**N/A[4]**
English holly	***Ilex aquifolium***	**Lowest**	**N/A[4]**
English hawthorn	***Crataegus monogyna***	**Moderate**	**N/A[4]**

*[1] Species in **bold** were observed during the 2015 Noxious Weed Inventory.*

[2] Source: VMP (PacifiCorp and EDAW 2004) and combined PacifiCorp and agency priority.

[3] ODA classification definitions (summarized from ODA 2012, see Appendix A, Table A-2):

A – Weed of known economic importance and of small enough infestations to make treatment possible; not known to occur, but known from neighboring states.

B – Weed of economic importance that is regionally abundant; may have limited distribution in some counties.

T – Target species from the A or B list for which ODA will develop and implement a statewide control plan.

[4] These species are not listed on ODA list of noxious weeds but are included here because of their invasive nature in natural ecosystems. Reed canarygrass is not a target species. English hawthorn and English holly are Douglas County "B" species and are new target species in 2015; the latter species was observed at one location in 2012 but not added to the database.

2.2 Terrestrial Weed Inventory

The 2015 Noxious Weed Inventory was conducted between August 3 and August 10, and between August 24 and August 29, 2015. AECOM biologists conducted the survey using a 4x4 vehicle and by walking. The survey crew used binoculars to inventory populations that were otherwise unsafe to access by foot or vehicle (e.g., steep slopes above open water).

Data were collected for previously documented (2003, 2006, 2009, and 2012) and new (2015) weed infestations in the inventory area, with focus on high priority areas identified in the VMP (Table 2–2).

Table 2–2. High priority areas identified in the Vegetation Management Plan.

High Priority Areas	
• Lands adjacent to Project facilities	• Recreation trails
• Recreation sites	• Transmission corridors
• Areas along canals	• Roadsides
• Riparian corridors	• Newly closed roads
• Reservoirs and impoundments	• Reservoir shorelines
• Residential areas	

The field crew used Trimble GeoXT and Geo7X GPS units and printed field maps to aid navigation, both of which showed previously documented weed infestations. Infestations were mapped as they occurred. In cases where the 2012 infestation location mapped in the geodatabase was in conflict with the 2015 GPS location, the 2015 GPS location took precedent and the 2012 infestation was moved to the 2015 location if it was within the GPS error, which ranged from < 1 meter to 5–10 meters depending on satellite coverage. If the infestation was outside the GPS error, it was treated as a new infestation.

New SITE_ID numbers were assigned to newly discovered infestations. The existing SITE_IDs for previously inventoried infestations were maintained and the boundaries modified when needed to document discernible change (+/- 0.1 acre) from previous inventories. In cases where an existing infestation expanded to include another adjacent infestation, one of the existing SITE_IDs was used for the combined infestation, assigned a status code of NEW-EX_C, and a comment added to indicate which infestation was absorbed. The old infestation SITE_ID was given a status of NO_A, and a comment was added to the geodatabase indicating in the final destination of these data. For each infestation, the survey protocols and the GPS application required the user to address the data collection categories shown below (Table 2–3). Abundance, cover, dominant age class, observed treatment method, and status were assessed and updated for each infestation. Previously documented infestations were assigned to a “no change” (NC) category when infestations showed no discernible change in number of plants and cover. Infestations from previous years where no infestation was found in 2015 were assigned a “no infestation observed” (NO) category. Infestations with a status of NO are considered historical

infestations and infestations with a status of NO_A will no longer be tracked, since they will be tracked through the infestation that absorbed them. All other infestations included in the 2015 field survey are considered active infestations.

Table 2–3. Data collection categories and values.

Data Categories	Values
Abundance	• 1 = <10 plants • 2 = 10-100 plants • 3 = 101-1,000 plants • 4 = >1,000 plants
Cover[1]	• Trace (T) = <1% • Low (L) = 1–5% • Moderate (M) = 5.1–25% • High (H) = 25.1–100%
Age Class[2]	• Seedling • Immature • 1st Year • Mature • Senescent
Observed Treatment[3]	• None • Pulling (manual) • Cutting / lopping (manual) • Solarizing (manual) • Digging (manual) • Grazing (manual) • Cutting (mechanical) • Mowing (mechanical) • Discing (mechanical) • Steaming (mechanical) • Herbicide
Treatment Comments	• Comments
Status[4]	• C (2012 infestations observed in 2015 that changed with respect to counts and/or cover since 2009) • NC (no change since 2012) • New (new infestation observed in 2015) • New-ex (2015 infestation expanded in size since 2012) • New-ex_C (infestation that expanded in 2015 and overlapped adjacent infestation(s)) • New-dec (2015 infestation decreased in size since 2012) • NO (2012 infestation with no plants observed in 2015 or infestation included in BLM or USFS treatment data that was not observed during the 2015 survey - mapped as historical infestation) • NO_A (2012 infestation that was absorbed by an adjacent infestation in 2015 and is no longer tracked as a unique infestation) • NS (infestation not inventoried) – assume attributes of previous inventory
Location (Project Section)[4]	• 1 = Transmission Line BLM • 2 = Transmission Line west of Toketee Switching Station • 3 = Slide / Soda Facilities • 4 = Fish Creek Facilities • 5 = Transmission Line Toketee Switching Station to Lemolo 2 Powerhouse • 6 = Toketee Lake Facilities • 7 = Clearwater Facilities • 8 = Transmission Line Clearwater • 9 = Transmission Line between Lemolo Powerhouses • 10 = Lemolo 2 Forebay / Canal • 11 = Lemolo 1 Powerhouse to Lemolo Lake
Comments	• General Comments

Notes:
[1] *Cover recorded using the Greater Yellowstone Area Guidelines for Coordinated Management of Noxious Weed cover classes as reported by the North American Weed Management Association (NAWMA 2002).*
[2] *Based on Oregon Natural Heritage Information Center (ORNHIC 2009) Rare Plant Field Survey Form Species Biology – Age Class Categories. Biologists noted the most dominant age class within the infestation.*
[3] *Based on categories outlined in PacifiCorp Settlement Agreement, Section 12 (PacifiCorp et al. 2001).*
[4] *Based on categories outlined in 2009 Noxious Weed Inventory Report (PacifiCorp 2010).*

The spatial information for new weed infestations found in 2015 was recorded using points or polygons. Some infestations less than 0.1 acre were recorded as GPS point data and assigned a buffer radius in the field based on the infestation size. Polygons were recorded with GPS-derived vertices and post-processed by differential correction using local base station data. The infestation data categories (Table 2-3) were assessed and collected for all new polygons.

The inventory protocol varied slightly according to a species' priority status (Table 2-1). High-priority and medium-priority species were documented wherever they occur. The lowest priority species, such as St. John's wort (*Hypericum perforatum*) and bull thistle (*Cirsium vulgare*), are widespread in and around the inventory area and were recorded only when infestation size was 0.1 acre or greater and over 25% cover.

The 2015 PacifiCorp weed inventory geodatabase was compared to the point and polygon GIS shapefiles provided by USFS and BLM for weed infestation treatments conducted between 2012 and 2015. The agency shapefiles were merged with the 2015 weed inventory shapefile in ArcMAP to the extent possible based on overlapping geographic features. The resulting merged GIS attributes file was then used to assist in combining point and polygon attributes files for the agency weed treatment data with the polygon attributes file for the 2015 weed inventory data in an Excel spreadsheet. The number of infestations treated, the years treated, and treatment type for each weed species was summarized using the resulting spreadsheet.

2.3 Geodatabase Development and Mapping

Upon completion of the inventory, differentially corrected field data were imported into an ESRI ArcGIS 10 geodatabase for processing, analysis, and mapping. Noxious weed infestation polygons were assigned to a Project section (as described in Section 1.3) using the center point of an infestation polygon. Data layers developed in 2015 were combined with PacifiCorp's existing GIS database to assess changes in noxious weed species and distribution. AECOM cross-referenced field observations with USFS and BLM infestation treatment records during completion of the 2015 data analysis.

Weed maps were created to illustrate the 2015 weed polygons (Appendix B). The maps include the 2015 infestations and historical infestation polygons (2003, 2006, 2009, and 2012) within the inventory area, the Project boundary, ownership, transmission line towers, facility buildings, public land survey sections, roads, and streams and other waterbodies.

As described previously, during 2015 surveys, polygons for some unique weed infestations had expanded and merged with adjacent infestations to form one large polygon. The resulting polygon used one of the two existing SITE_IDs from the original infestation to identify the polygon in 2015. A status code of NEW-EX_C was used for the resulting polygon and a comment was added to the geodatabase indicating the SITE_ID of the polygon that had been

combined into the original polygon. For example, if infestation ABCD-10 were to be combined with ABCD-11, then the mapped polygon would be labeled ABCD-10 with a comment that in 2015 this polygon was combined with ABCD-11. The record for ABCD-11 would be given a status of NO_A to indicate it had been absorbed by ABCD-10.

Following fieldwork, AECOM conducted a quality assurance/quality control (QA/QC) check of the geodatabase to ensure that all weed infestations (polygons) from 2012 were accounted for in the 2015 records. There was also an accounting of potential duplicate labeling, logical consistency for changes in status with assessment of abundance (number of plants) and cover, consistency of similar terminology in comments, confirmation of absorbed infestations that will no longer be tracked (NO_A), as well as providing global data not entered into the data dictionary in the field (i.e. scientific and common names, project section, treatment priority, land ownership, map sheet numbers etc.).

3.0 Results

This section describes the results of the 2015 Noxious Weed Inventory. Each noxious weed species documented during the 2015 inventory is described below, along with number of occurrences, size of infestations (reported as minimum/maximum/mean acreage), the Project sections where infestations were observed, and if the infestation is new or was previously documented and has been eliminated, changed, or remains the same. Map sheet references are included for particular infestations and refer to the map sheets in Appendix B. Appendix C contains a complete listing of the 2015 noxious weed inventory records, sorted by Project section. Treatment data referenced in the results were obtained in 2015 from the USFS (Bryan Benz, UNF Botanist, July 17, 2015) and BLM (Johanna Blanchard, Roseburg District Botanist, July 21, 2015).

Sixteen weed species were found in 2015, the same number as in 2012. However, two species found in 2012 were not found in 2015, English ivy (*Hedera helix*) and yellow starthistle (*Centaurea solstitialis*), and two new species were added in 2015 that were not found in 2012, English hawthorn and English holly. One additional weed species, rush skeleton (*Chondrilla juncea*), was treated by the USFS prior to the 2015 field survey but was not observed during the field survey. Italian plumeless thistle (*Carduus pycnocephalus* [CAPY-1]; map sheet 12) was first found in 2009 but was not observed in 2012 or 2015, and diffuse knapweed (*Centaurea diffusa* [CEDI-1]; map sheet 36) has not been observed since 2006.

There were 284 new infestations mapped in 2015, and three species account for 77% of all new infestations: Himalayan blackberry (*Rubus armeniacus*; 33%), Scotch broom (*Cytisus scoparius*; 25%), and meadow knapweed (*Centaurea debeauxii*; 19%). Section 2 (the Transmission Line West of Toketee Switching Station Project) contained the vast majority of these new infestations. Sixty-nine percent of all new infestations had between 1 and 9 individuals, and 62% of these were already mature.

From 2012 to 2015, the total number of observed active weed infestations increased by 113 infestations (Table 3–1). However, the total infestation area decreased by 0.5 acre, from 146.7 acres in 2012 to 146.2 acres in 2015. The 113 additional active infestations in 2015 are the net result of the 284 new infestations documented in 2015, minus infestations from 2012 that were not found in 2015 or were combined into newly expanded infestations.

Many infestations are located along Project access roads and appear to be outside of the FERC Project boundary. Based on observations in the field, the locations of some of these access roads are not accurately mapped. This occasionally created situations where infestations appear to be

outside the FERC boundary on the figures, but this is because the roads are not accurately mapped.

Sixteen infestations (CEPR-507, -515, -594; CIAR-5; SEJA-13, -14, -15, -18, -19, -20, -21, -34, -513, -514, -527, -528) of the historical and active infestations from 2012 were not re-visited in 2015. In some cases, access roads across private property were blocked by locked gates. Several tansy ragwort (*Senecio jacobaea*) infestations on the Soda Springs Reservoir were not safe to access—they were likely recorded in past aquatic weed inventories and are not visible from access roads or viewpoints above the reservoir. The unvisited infestations were assumed to have maintained their 2012 status.

Table 3–1. Number and size of active infestations recorded during 2003–2015 inventories.

	Number of Active Infestations					Area (Acres)				
Species	**2003**	**2006**	**2009**	**2012**	**2015**	**2003**	**2006**	**2009**	**2012**	**2015**
Bull thistle	11	2	3	8	9	0.64	0.15	0.01	0.22	0.36
Canada thistle	39	36	29	38	32	4.13	3.63	0.87	0.50	0.44
Diffuse knapweed	0	1	0	0	0	0	0.16	0	0	0
English hawthorn[1]	-	-	-	-	2	-	-	-	-	0.002
English holly[1]	-	-	-	-	4	-	-	-	-	0.03
English ivy	1	2	1	1	0	0.01	0.05	0.01	0.01	0
Giant knotweed	3	2	2	2	1	0.18	0.17	0.10	0.10	0.08
Himalayan blackberry	141	145	158	184	252	11.00	12.51	13.97	14.00	15.21

Notes:
[1] *English hawthorn and English holly were not surveyed in years prior to 2015.*
[2] *Two Rush skeletonweed infestations were treated by the USFS prior to the 2015 weed inventory.*

3.1 Results by Species

The 2015 status of the 16 observed species and their distribution among the 11 Project sections are reported below along with discussion of treatments conducted by BLM and USFS. Species not observed in 2015 but mapped in 2006, 2009, or 2012 are also discussed. Note that infestation naming conventions for SITE_IDs from the 2003 inventory used older scientific names. These older naming conventions remain in use for consistency, although currently accepted scientific names are provided.

Point and polygon data for noxious weed infestations treated between 2012 and 2015 were provided by the USFS and the BLM. These data represented 253 treated infestations within the FERC Project boundary. Of these, 245 infestations on USFS land and 8 infestations on BLM land have been mapped by PacifiCorp as of 2015. Thirty nine of the 245 infestations were identified and treated by the USFS since 2012 and were not included in the PacifiCorp database prior to the 2015 field inventory so they were not specifically visited and assessed during the 2015 field inventory. During development of the treatment summaries for each weed species the 39 infestations were given PacifiCorp identifiers (SITE_ID with sequential numbering as necessary) and added to the geodatabase as historical occurrences (Status=NO) since we did not observe and record weeds in these locations during the survey; in 2015 it is assumed that the treatments were successful and these infestations were no longer present. Subsequent surveys in 2018 and beyond will determine if treatments were ultimately successful. The summaries by species presented below include information on treatments conducted by USFS and BLM between 2012 and 2015.

3.1.1 Quackgrass (*Elymus* [syn. *Agropyron*] *repens,* AGRE)

In 2015, the status and acreage of two previously documented quackgrass infestations (AGRE-1 and AGRE-2) have changed since 2012. AGRE-1 (map sheet 37) is a mature population located near the residences in Toketee Village. Since it was first discovered in 2003, it was expanded in 2009 and again in 2015. The AGRE-2 (map sheet 12) infestation was unchanged from 2009 to 2012, but was not observed in 2015. It was first located on a spoils pile at a dump site/borrow pit under transmission line 39 along BLM road number 26-2-17.1. There are no records from the USFS or BLM as having treated these infestations, but AGRE-2 may have been affected by dump/borrow pit activities. The one remaining polygon of quackgrass is 0.07 acre.

Quackgrass is a moderate priority species, consistent with its inclusion on the ODA B List (considered too widespread to be efficiently treated by intensive control efforts) (Table 2-1). Given the limited number of infestations in the inventory area, treatment efforts could be applied to reduce the spread of this species within the Project boundary.

3.1.2 Italian Plumeless Thistle (*Carduus pycnocephalus,* CAPY)

Italian plumeless thistle was not found during the 2012 or 2015 inventories. One infestation (CAPY-1; map sheet 12) of this high priority species was recorded in 2009 as occurring on a spoils pile at a dump site located under transmission line 39A along with numerous other noxious weed species. There was no observed evidence of treatment, and no treatment records were provided by the BLM in 2012 or 2015.

3.1.3 Diffuse Knapweed (*Centaurea diffusa*, CEDI)

Diffuse knapweed was not found during the 2015 survey. One infestation (CEDI-1; map sheet 36) of this high priority species was first observed during 2006 inventory, but it was not observed in 2009, 2012, or 2015. Intensive treatment between 2006 and 2009 by USFS crews included herbicide treatment in 2007 and hand pulling in 2006, 2008, and 2009. A second, small infestation (CEDI-2) was recorded nearby and treated by the USFS prior to 2012. These occurrences were updated to historical status in 2012 and kept in 2015.

3.1.4 Spotted Knapweed (*Centaurea stoebe* [syn. *maculosa*], CEMA)

The number of spotted knapweed infestations increased from 29 to 36 between 2012 and 2015, a 24% increase. However, the overall infested area remained unchanged at 0.71 acre, and the minimum/maximum/mean infestation size also remained unchanged at trace/0.16/0.02 acre, respectively.

In 2015, spotted knapweed was most prevalent along Lemolo 2 Forebay/Canal (25 of 36 infestations; 0.5 acre), much like it was in 2009 and 2012. Spotted knapweed is considered a high priority noxious weed in the Project boundary, and the ODA considers this species to be a priority for focused control efforts (Table 2–1).

According to USFS treatment records, 139 treatments were conducted on 76 spotted knapweed infestations from 2012 to 2015; 43 infestations were treated two to four times. Treatment entailed manual methods of picking, digging, and pulling plants.

In 2015, 56 treated infestations had no observed plants, 36 of which also had no observed plants in 2012. Ten of 56 treated infestations with no plants observed in 2015 (CEMA-6, 7, 8, 9, 10, 16, 43, 46, 51 and 53; map sheets 52, 53, 54 and 55) were observed to support spotted knapweed in 2012. As described in Section 3.1 above, 10 of 56 treated infestations with no plants in 2015 were not surveyed but based on USFS treatment location records were added to the 2015 database as historical records (status=NO) to track in future inventories.

Twenty of 76 treated infestations continued to support spotted knapweed. Five treated infestations (CEMA-12, 19, 25, 26 and 45; map sheets 53, 54 and 55) did not support spotted knapweed in 2012 but it was present in 2015. Only seven of the 20 infestations were observed to have fewer plants or lower ground cover. Apparently, spotted knapweed has the ability to re-

establish following manual treatment and repeated treatments at least temporarily can reduce plant numbers to zero. Manual treatment does not appear to be a permanent control for this species.

Treatment efforts of the USFS were focused primarily in Section Lemolo 2 Forebay/Canal (71 infestations) although infestations were also treated in other Project sections, including Clearwater Facilities (1), Fish Creek Facilities (1), Transmission Line Clearwater (1), Transmission Line West of Toketee (1) and Toketee Lake Facilities (1). Twenty three spotted knapweed infestations have received no treatment, eight of which are new infestations observed in 2015. The majority of spotted knapweed infestations inventoried in 2015 consisted of mature flowering plants and first-year rosettes indicating that reproduction would be expected the next growing season.

3.1.5 Meadow Knapweed (*Centaurea moncktonii* [syn. *pratensis*], CEPR)

The number of meadow knapweed infestations increased from 133 to 170 between 2012 and 2015, a 28% increase. Similarly, the overall area infested increased by 8% from 6.11 to 6.59 acres between 2012 and 2015. The minimum/maximum/mean infestation size was trace/1.58/0.04 acre.

Meadow knapweed was observed in every Project section. The largest infestations were located in the Transmission Line West of Toketee Switching Station Project section, which increased 7% in acreage (from 2.96 to 3.16 acre). Fifty-five new infestations of meadow knapweed were observed in 2015. They account for 32% of meadow knapweed infestations and 9.0% (0.59 acre) of the total infestation area. From 2012 to 2015, at least one new meadow knapweed infestations was found in every project section except the Toketee Lake Facilities Project section. Meadow knapweed is considered a moderate priority noxious weed in the Project boundary.

Large relative increases in the size of infestation area occurred at the Transmission Line Clearwater and Lemolo 2 Forebay Canal Project sections, whereas decreases in infestation area occurred at the Slide/Soda Facilities, Fish Creek Facilities, and Lemolo 1 PH Project sections. This suggests that while treatments appear to be controlling some existing meadow knapweed populations, new infestations continue to invade areas of the Project.

According to USFS treatment records, 64 treatments were conducted on 47 meadow knapweed infestations from 2012 to 2015; 15 of 47 infestations were treated two to three times. Treatment consisted mostly of manual methods including picking, digging, and pulling plants. Black matting (solarization) was also observed often with meadow knapweed escaping out the edges of the matt.

There were 20 treated meadow knapweed infestations with no observed plants in 2015, 12 of which also had no observed plants in 2012. Six of the 20 treated infestations were not surveyed

in 2015 but based on USFS treatment location records (CEPR-125 on map sheet 52; -676, and -683 on map sheet 37; -682 on map sheet 43; -674 and -675 on map sheet 50) were adopted into the database as historical records (status=NO) to track in future inventories. Two of the treated infestations had meadow knapweed in 2012 (CEPR-88 on map sheet 39; -506 on map sheet 43) but not in 2015.

In 2015, 27 of the 47 treated infestations continued to support meadow knapweed. Four treated infestations (CEPR-56 on map sheet 56; -47 on map sheet 50; -85 on map sheet 37; -599 on map sheet 39) had no plants observed in 2012 but had recolonized by 2015 despite the treatment. One of the infestations treated between 2012 and 2015 decreased in area (CEPR-628 map sheet 35). Twelve treated infestations had no change in status. Three infestations changed status, two of which increased in abundance (CEPR-526 on map sheet 43; -530 on map sheet 51) and one that decreased in abundance (CEPR-517 on map sheet 50). CEPR-515 on map sheet 41 was not surveyed in 2015 because it was overlooked along Fish Creek Canal.

The mixed responses of meadow knapweed to treatment demonstrates that meadow knapweed has the ability to re-establish following manual treatment, although repeated treatments can at least temporarily reduce observable plant numbers to zero. Manual treatment does not appear to be a permanent control for this species.

Infestations within nine different Project sections were treated by the USFS including Lemolo 2 Forebay/Canal (11), Fish Creek Facilities (10), Transmission Lines West of Toketee Switching Station (8), Toketee Lake Facilities (6), Slide/Soda Facilities (4), Transmission Line between Lemolo Powerhouses (4), Clearwater Facilities (2), Transmission Line Clearwater (1), and Transmission Line Toketee Switching Station to Lemolo 2 Powerhouse (1).

The majority of meadow knapweed infestations inventoried in 2015 were mature and had set seed this year. First-year rosettes were also often present indicating seed production is likely during the next growing season if this biennial species. Meadow knapweed is a moderate priority species with many new infestations in the Project area particularly along Project roads. An effort to control many of the small outlier infestations at the leading edge of expansion should be prioritize for treatment effort.

3.1.6 Rush skeletonweed (*Chondrilla juncea*, CHJU)

Rush skeletonweed was not observed during the 2015 inventory, or during any of the previous survey inventories. It is a high priority species that was treated by the USFS between 2012 and 2015. Based on USFS treatment data, a total of two infestations (CHJU-1 and CHJU-2 on map sheets 38 and 36, respectively) were treated.

3.1.7 Yellow Starthistle (*Centaurea solstitialis*, CESO)

No yellow starthistle infestations were observed in 2015. Two infestations, CESO-1 and CESO-2, have not been observed since 2003. All past occurrences have been limited to the Lemolo 2 Forebay/Canal Project section. Overall, the number and areal cover of yellow starthistle have been low.

Yellow starthistle is considered a high priority noxious weed in the Project boundary. A few of the plants observed in 2012 were flowering, although plants were generally only up to 6 inches tall, which is atypical for this species. The habitat may not be ideal for this species, but any future infestations should be made a high priority for treatment, and historical infestations should be carefully monitored in the future.

Treatment occurred at four infestations (CESO-3, 4, 5 and 6 on map sheet 54) in 2012 and 2014 with 3 plants and 21 plants, respectively. These were dug and pulled in the USFS treatment area that overlaps these infestations.

3.1.8 Canada Thistle (*Cirsium arvense*, CIAR)

The number of Canada thistle infestations decreased 16% (from 38 to 32) between 2012 and 2015. Overall area decreased 12% from 0.5 to 0.44 acres between 2012 and 2015. The minimum/maximum/mean infestation size was trace/0.09/0.014 acre. This species was present in seven of the 11 Project sections in 2012 and 2015, but is most prevalent in Project Sections 2, 4, and 6 (T-Line West of Toketee SS, Fish Creek Facilities, and Toketee Lake Facilities).

Based on USFS data, there were treatments conducted at the Fish Creek Facilities at or in close proximity to four Canada thistle infestations (CIAR-22 on map sheet 40 and CIAR-2, -29, and -549 on map sheet 41). One additional Canada thistle infestation (CIAR-31on map sheet 50) was also treated at Toketee Lake Facilities. Canada thistle was observed at only one of the six treated infestations (CIAR-2) during the 2015 inventory. However, two treated infestations, CIAR-31 and -549, were not surveyed in 2015 but were added to the database based on USFS treatment location records. These infestations were treated using manual methods of digging, cutting and pulling. One treated infestation was also re-seeded with native plant species.

Canada thistle is considered a moderate priority noxious weed in the Project boundary. Initially, this species appears to colonize areas; however, over the long term these habitats may be too dry or too shaded to support this species. Some new colonies have been found growing in relatively dry and/or shaded habitats, which may not be suitable to sustain them into the future. Those infestations growing in more mesic habitats, where they have greater potential to expand and provide a seed source for further colonization of sensitive wetland habitats, should be prioritized for treatment.

3.1.9 Bull Thistle (*Cirsium vulgare*, CIVU)

The number of bull thistle infestations increased from eight locations in 2012 to nine in 2015. Overall area increased 64%, from 0.22 acre in 2012 to 0.36 acre in 2015. The minimum/maximum/mean infestation size was trace/0.16/0.04 acre.

Two bull thistle infestations are new in 2015 and five are unchanged from 2012. Two infestations that were new in 2012 were not found in 2015 and two others have not been found since 2009. All nine infestations were mature.

Bull thistle is considered a low priority species in the Project boundary. This species is ubiquitous in the Project area but seldom forms large infestations. The USFS provided no record of treating this species, and no observations of treatment were made during the 2015 inventory. The two largest infestations, CIVU-10 (map sheet 63) and CIVU-16 (map sheet 50), occur in the Lemolo 1 Powerhouse to Lemolo Lake Project section and the Transmission Line between Toketee Switching Station and Lemolo 2 Powerhouse Project section, respectively. Together, these two infestations occupy 77% (0.28 acre) of the total bull thistle infestation area.

3.1.10 English Hawthorn (*Crataegus monogyna*, CRMO)

English hawthorn is a noxious weed that was not listed in previous Project documents. It was added to the 2015 weed inventory list of target species at the request of BLM. Two new, small infestations were recorded in 2015 that total 0.002 acre. CRMO-1 (map sheet 11) is in the Transmission Line BLM Project section, and CRMO-2 (map sheet 30) is in the Transmission Line West of Toketee Switching Station.

3.1.11 Scotch Broom (*Cytisus scoparius*, CYSC)

Scotch broom remains the most abundant noxious weed species in the inventory area, both in number of infestations and area, even though it has decreased slightly since 2012. The number of Scotch broom infestations decreased from 266 to 265 between 2012 and 2015, and overall area decreased less than one percent, from 78.7 to 77.5 acres. The minimum/maximum/mean infestation size was trace/16.9/0.29 acre.

The Transmission Line BLM Ownership Project section had the highest areal cover of Scotch broom: 51 Scotch broom infestations covered 51 acres in 2015, approximately 1 acre less than in 2012 for this section. The highest number of infestations (102) occurred in the Transmission Line West of Toketee Switching Station Project section and covered 17.6 acres.

From 2012 to 2015, six Project sections had an increase in the number and size of Scotch broom infestations, four Project sections had a decrease in the number and size of infestations, and one (Toketee Lake Facilities) had an increase in the number of infestations but a decrease in size.

Project sections that had an increase in number and size of infestations were Lemolo 1 Powerhouse to Lemolo Lake, Transmission Line between Lemolo Powerhouses, Transmission Line BLM Ownership, Transmission Line Clearwater, and Transmission Line Toketee Switching Station to Lemolo 2 Powerhouse. Project sections that showed a decrease in number and size of infestations were Clearwater Facilities, Fish Creek Facilities, Lemolo 2 Forebay/Canal, and Slide/Soda Facilities.

On BLM lands (Transmission Line BLM Ownership Project section) in 2012, there were 20 infestations (CYSC-501, -502, -503, -505, -506, -507, -510, -515, -517, -521, -541, -542, -543, -545, -577, -578, -580, -658, -663, -664) observed with dead remnants of mature Scotch broom. Most of these infestations are believed to have been sprayed with herbicide prior to 2006 based on observations during the 2006 weed inventory. The initial effect of herbicide treatment was a large reduction in numbers and cover of Scotch broom. However, while the old dead remnants of chemically treated plants are decomposing, new Scotch broom growth was widely observed sprouting within these treated areas in 2012 and 2015.

Based on BLM records, Scotch broom was chemically treated in 2014 along five roads that within the FERC boundary in the Transmission Line BLM Ownership Project section. The seven infestations within the FERC boundary that were potentially sprayed, occur along Hill Creek Road (CYSC-508 on map sheet 11), Ace Williams Road (CYSC-518 on map sheet 19), Thunder Mountain Road (CYSC-521 on map sheet 20), Bob Butte Road (CYSC-580, -664, and -742 on map sheet 21) and Smith Springs Road (CYSC-543 on map sheet 22). CYSC-508 was not found to be present during the 2015 surveys indicating the treatment was successful. However, no evidence of treatment was observed in the field at the Scotch broom infestations treated on BLM lands in 2015.

According to USFS treatment records, 89 treatments were conducted on 70 Scotch broom infestations from 2012 to 2015; 17 infestations were treated two times each in 2012 and 2015. Pulling and cutting plants were the primary manual methods of treatment.

On USFS land in 2015, there were 36 of 70 treated infestations with no observed plants, 12 of which also had no observed plants in 2012. These data demonstrate that plants had re-established since 2012 but that the treatments have at least temporarily reduced plant numbers in 2015. Thirteen of the 36 infestations with no observed plants in 2015 were observed to support Scotch broom in 2012, again demonstrating the effectiveness of current treatment methods to reduce abundance. Eleven of the treated infestations were not surveyed but were added to the database based on USFS treatment location records.

The remaining 34 USFS-treated infestations were all observed to support Scotch broom in 2015. Seven of these treated infestations were newly documented in 2015. Four treated infestations decreased in area and 11 changed status with a mixture of increases and decreases in number of

plants and ground cover since 2012. One would expect a consistent decrease in abundance in response to treatments; however, two treated infestations actually increased in area due to combining older infestations, although plant abundance had decreased since 2012. The remaining 12 treated infestations demonstrated no change in abundance between 2012 and 2015.

Scotch broom is considered a high priority noxious weed in the Project boundary. The treatment methods for Scotch broom have mixed results with regard to reducing abundance. Several treatments of Scotch broom were observed in 2015. Manual pulling appeared to be the most effective. Many individuals that were lopped often had several new, robust shoots growing from the lopped base. Longer-term efforts requiring multiple treatments of individual infestations will be the best strategy for achieving consistent reductions in Scotch broom abundance. However, Scotch broom is very abundant in the inventory area, and it is unrealistic to think it can be thoroughly eradicated. A realistic goal is to prevent its spread into new areas that are of concern to land management agencies, and focus on areas where low infestation numbers make eradication possible.

3.1.12 English Ivy (*Hedera helix*, HEHE)

No English ivy was observed during the 2015 inventory. One 0.013-acre infestation of English ivy (HEHE-1; map sheet 37) was observed during the 2003, 2006, 2009, and 2012 inventories. This infestation was located behind a PacifiCorp-owned residence near the Toketee Control Center in the Transmission Line West of Toketee Switching Station Project section. The only other infestation (HEHE-501; map sheet 12) has not been observed since it was first recorded in 2006. It was located along access road TL39_05/19 in the Transmission Line BLM Ownership Project section.

English ivy is considered a high priority noxious weed in the Project boundary. Eradication of English ivy using manual methods most often requires repeated treatments. Solarization can be effective, provided the treatment is maintained and covers the entire infestation.

3.1.13 St. John's wort (*Hypericum perforatum*, HYPE)

The number of infestations of St. John's wort increased by 14% from 22 to 25 between 2012 and 2015, and the change in overall coverage area was 2%. The minimum/maximum/mean infestation size was 0.01/22.6/1.6 acres.

St. John's wort has the lowest priority in the Project boundary but, at almost 40 acres, was the second-most prevalent noxious weed by area in 2015. It is ubiquitous in the Project boundary, although the largest, densest infestations occur in the Clearwater Facilities and Lemolo 1 Powerhouse to Lemolo Lake Project sections. Three new infestations were recorded in 2015: HYPE-23 (map sheet 37), HYPE-25 (map sheet 42), and HYPE-27 (map sheet 57). Many infestations were not mapped because they did not meet the minimum mapping requirements for this species—patches greater than 0.1 acre and over 25% cover. Note that in 2009, some large

infestations were mapped regardless of cover in an effort to capture infestations for management planning. In general, eradication of St. John's wort is highly unlikely, and resources are better spent on treating noxious weeds with higher priority in the Project area.

3.1.14 English Holly (*Ilex aquifolium*, ILAQ)

English holly is a noxious weed that was not listed in previous Project documents; it was added to the target weed list in 2015 at the request of the BLM. Four infestations were recorded in 2015. Two mature infestations (ILAQ-1 and ILAQ-3, map sheet 43) were both observed on a floodplain area where the Clearwater River joins Toketee Lake. One small infestation (ILAQ-2, map sheet 37) was observed in the Slide/Soda Facilities Project section and another (ILAQ-4, map sheet 11) was in the Transmission Line BLM Project section—these two infestations were immature in 2015. The minimum/maximum/mean infestation size was trace/0.03/0.01 acre.

In 2012, English holly was observed in the Transmission Line BLM Project section (map sheet 12). It was not mapped because it was not on the list of target species, did not have a priority ranking in the VMP, and was not ranked by the ODA. It is recommended to treat the English holly infestations early, before the berries can develop and be spread by birds. This species is shade tolerant and can survive in undisturbed forests.

3.1.15 Yellow Toadflax (*Linaria vulgaris*, LIVU)

One yellow toadflax infestation was tentatively identified during the 2009 and 2012 Noxious Weed Inventories (LIVU-1; map sheet 50). Its abundance status changed in 2015 from <10 plants to 10-100 plants, although the overall cover of the infestation remained at trace levels.

The growth form of these plants is atypical, with floppy stems and diminutive leaves, and it is not sexually reproductive (no flowers). Dense shade is believed to limit typical growth and reproduction. It is suspected that vegetative reproduction via rhizomes is not occurring or is occurring very slowly. The infestation was located in Toketee Lake Facilities south of Toketee Campground, an area where yellow toadflax was previously treated by the USFS. Yellow toadflax is considered a high priority noxious weed in the Project boundary.

Yellow toadflax (LIVU-1), first observed in 2009, was present in 2012 and 2015, but the plants had diminutive, weak, trailing stems where it was growing in densely grassy and shady habitat. In 2015, as in 2009 and 2012, there was no flower and fruit production that could be used to positively identify these plants. However, the growth form, stem and leaf characteristics strongly suggest these plants are yellow toadflax.

3.1.16 Reed Canarygrass (*Phalaris arundinacea*, PHAR)

Reed canarygrass is not considered a noxious weed by the ODA, nor is it included as a target weed species within the Project boundary. However, it is included in the inventory because of its aggressive nature in wetlands and riparian areas. The number of reed canarygrass infestations

increased from eight in 2012 to 13 in 2015. The overall area increased by approximately 12%, from 0.61 acre in 2012 to 0.69 acre in 2015. The minimum/maximum/mean infestation size was trace/0.31/ 0.05 acre.

In 2015, five infestations were present in the Lemolo 2 Forebay/Canal Project section, including two new infestations (PHAR-20 and PHAR-22, map sheet 51). Four infestations occur in the Lemolo 1 Powerhouse to Lemolo Lake Project section, including the new PHAR-26 (map sheet 63). New infestations were also observed in the Fish Creek Facilities (PHAR-24, map sheet 37) and Transmission Line Toketee Switching Station to Lemolo 2 Powerhouse (PHAR-18, map sheet 46) Project sections.

The largest infestation (PHAR-16; 0.31 acre; map sheet 63) was first mapped in 2012 and remains in the spillway downstream of Lemolo Lake dam in the Lemolo 1 Powerhouse to Lemolo Lake Project section. Several infestations (PHAR-1 through PHAR-7, and PHAR-9) have not been observed since the 2006 inventory.

According to prior USFS records, PHAR-4 (map sheet 43) was manually treated in 2007 and 2008. This infestation was not present in 2009, 2012, or 2015. Infestation PHAR-12 (map sheet 50) at Toketee Lake was observed to have received solarization treatment during 2012, although the records indicate no change since it was first mapped in 2009. There is no record of this treatment in the USFS data. The treatment of PHAR-12 at Toketee Lake is a good example of prioritizing treatment of reed canarygrass, which can easily spread and infest wetland areas around the lake. The infestation, PHAR-16, at Lemolo Lake spillway should be a high priority for treatment given the high probability of downstream dispersal of seed into additional wet habitats.

3.1.17 Sulfur Cinquefoil (*Potentilla recta*, PORE)

Five sulfur cinquefoil infestations were observed in 2015, a 29% decrease from the seven infestations observed during 2012. Overall area decreased by 49%, from 0.22 to 0.12 acre between 2012 and 2015. The minimum/maximum/mean infestation size was trace/0.05/0.02 acre.

Sulfur cinquefoil infestations were present in three Project sections in 2015, one less than 2012: three in Transmission Line West of Toketee Switching Station, and one each in Slide/Soda Facilities and Toketee Lake Facilities. One new infestation (PORE-16, map sheet 50) was recorded at the Toketee Lake Facilities Project section. The remaining four infestations (PORE-5, -6, -11, -12) remain unchanged from 2012.

Only one of the 16 treated infestations (PORE-11, map sheet 37) was observed to support sulfur cinquefoil in both 2012 and 2015. Five treated infestations (PORE-17, 18, 19, 20, and 21on map sheets 46, 35, 50, 43, and 37, respectively) were added to the database in 2015 (as historic records with STATUS=NO) based on USFS records; they were not visited during the 2015 field

inventory, and it is not known if they support sulfur cinquefoil. Nine of the treated infestations were confirmed not to have plants in 2015, and one was newly identified during the 2015 survey (PORE-16). Sulfur cinquefoil is a high priority species whose abundance appears to be consistently reduced by manual treatment.

3.1.18 Giant Knotweed (*Polygonum sachalinense*, POSA)

Only one of the three previously recorded giant knotweed infestations was found in 2015 (POSA-1, map sheet 43). Infestation POSA-1 (map sheet 50) was observed during each inventory since 2003 and is 0.08 acre in size. POSA-1 has continually been treated by solarization matting since 2003 yet each periodic inventory has documented resprouting from underneath the matting. The infestation POSA-2 (map sheet 37) has not been observed during PacifiCorp inventories since 2003 but received manual and solarization treatment in 2007–2008 according to USFS records. Solar fabric was removed from POSA-3 (map sheet 50) in late 2012 and no new sprouts were observed in 2015.

This species is considered a high priority noxious weed in the Project area. The one infestation observed during 2015 occurred in the Transmission Line Toketee Switching Station to Lemolo 2 Powerhouse Project section adjacent to the USFS Lower Clearwater Village. Previous giant knotweed infestations have received solarization treatment since they were first inventoried in 2003, but stems have been observed resprouting from beneath the solarization fabric. Infestations should be revisited during future inventories to evaluate treatment success. Cut and spray treatment method should be considered.

3.1.19 Himalayan Blackberry (*Rubus armeniacus* [syn. *discolor*], RUDI)

Himalayan blackberry is present throughout the inventory area and has the second highest number of infestations. The number of Himalayan blackberry infestations increased by 37% from 184 to 252 between 2012 and 2015. Over this time period, the overall infestation area increased 9%, from 14 to 15.2 acres, between 2012 and 2015. The minimum/maximum/mean infestation size was trace/2.8/0.05 acre.

The 2015 Terrestrial Weed Inventory found Himalayan blackberry present in all 11 Project sections. The most infestations occur in the Transmission Line West of Toketee Switching Station (44%), Transmission Line BLM ownership (19%), Slide/Soda Facilities (13%), and Toketee Lake Facilities (12%) Project sections. Two infestations have decreased in size (RUDI-501 and -506), and 23 infestations have expanded in size. Ninety-four new infestations (37%) were observed in 2015.

Himalayan blackberry is considered a high priority noxious weed in the Project boundary. According to USFS treatment records, 12 Himalayan blackberry infestations were treated from 2012 and 2014. Four treated infestations (RUDI-78, -610, -717 and -720 on map sheets 37, 50

and 53) supported no Himalayan blackberry in 2015. The remaining eight treated infestations all supported blackberry in 2015.

Two treated infestations (RUDI-622 and 719 on map sheets 50 and 26) were newly discovered in 2015 and three others (RUDI-9, 96 and 563 on map sheets 50, 52 and 43) had no change in status since 2012 despite having been treated. RUDI-145 and -146 (map sheet 50) increased in abundance in 2015, which suggests it may not have been the focus of treated blackberry infestations in the vicinity. RUDI-77 (map sheet 37) also increased slightly in abundance in 2015 after being treated in 2013. The manual methods of lopping and digging were used with mixed success at reducing Himalayan blackberry abundance.

3.1.20 Tansy Ragwort (*Senecio jacobaea*, SEJA)

The number of tansy ragwort infestations increased by 2%, from 50 to 51 infestations between 2012 and 2015. While this is a net increase of one infestation, the overall area decreased by 54%, from 2.96 to 1.36 acres. Twenty-two infestations were newly discovered. The minimum/maximum/mean infestation size was trace/0.50/0.03 acre.

The Slide/Soda Facilities and Lemolo 2 Forebay/Canal Project sections contained the most infestations in 2015, at 12 (24%) and 11 (22%), respectively. All 11 Project sections contained at least one infestation of tansy ragwort.

The USFS pulled plants at three locations, SEJA-1 and SEJA-47 on map sheet 41 in 2013 and SEJA-48 on map sheet 42, in 2014, within the Fish Creek Canal Project section. No plants were observed at these 3 infestations in 2015.Tansy ragwort is considered a moderate priority noxious weed in the Project boundary.

3.1.21 Medusahead Rye (*Taeniatherum caput-medusae*, TACA)

The number of medusahead rye infestations remained at 40, unchanged from 2012 to 2015. Overall area decreased slightly from 3.42 to 3.41 acres. The minimum/maximum/mean size of infestations was trace/1.05/0.09 acre.

The Transmission Line West of Toketee Switching Station Project section had the most infestations (34), including four new infestations in 2015. The Transmission Line BLM Ownership Project section had four infestations, and the Lemolo 2 Forebay/Canal had two infestations.

According to USFS treatment records, 12 treatments were conducted on seven medusahead rye infestations from 2012 to 2015; three infestations were treated two to four times each between 2012 and 2015. Mowing, weed-whip, pulling, and digging plants were the manual methods of treatment.

Only one of the treated infestations (TACA-28, map sheet 39) was observed to not support medusahead rye in 2015. Another treated infestation (TACA-55 on map sheet 54) was not surveyed in 2015 but was added to the database as a historic polygon (STATUS=NO) based on USFS treatment location records. Four treated infestations (TACA-42 on map sheet 34, TACA-13 on map sheet 38; TACA-16 and 40 on map sheet 53) supported medusahead rye at much lower abundance compared to 2012. TACA-13 on map sheet 38 is the only medusahead rye infestation present in 2012 that was unaffected by treatment. Medusahead rye is a moderate priority species whose abundance appears to be fairly consistently reduced by manual treatment.

Plant abundance at individual infestations of this annual species is expected to fluctuate from year to year depending on how seed reproduction is affected by growing conditions. Years of low abundance may affect the ability to find plants in some years, which likely explains why in some years no plants are observed in untreated infestations only to be found during the next survey period. Infestations of annual species are also expected to shift from year to year, depending on seed dispersal patterns, competition with other species, and the availability of suitable substrates. Further, medusahead rye seedheads are very difficult to see late in the summer, as it is in its senescent state and blends in with many of the other dry, yellowish annual grass species.

Most infestations found to date occur in the hottest, driest gravelly patches along existing access roads and around transmission line towers. Infestations along roads also provide opportunities for vehicles to move seeds into new areas.

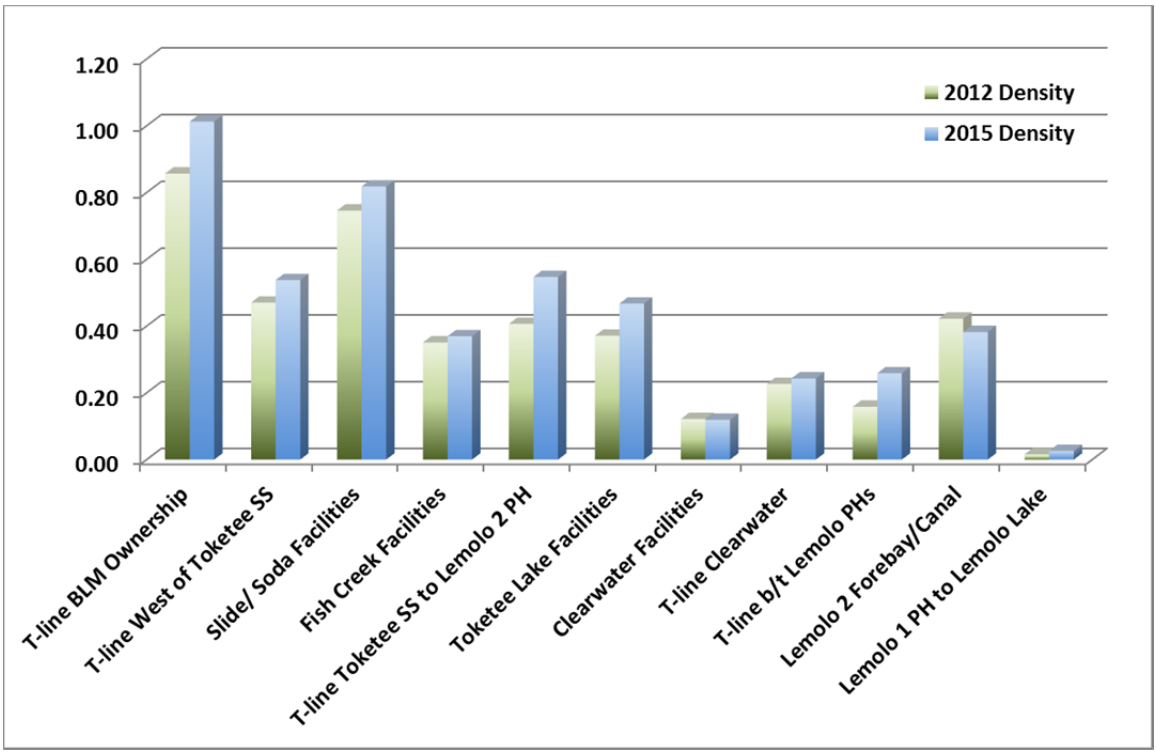
3.2 Infestation Density by Project Section

The 113 additional infestations in 2015 (14% more than 2012) involved an overall density increase in all but one of the Project sections compared to 2012—the Lemolo 2 Forebay/Canal Project sections decreased by 7% compared to 2012. The net change in the number of infestations by Project section in 2015 are as follows: Clearwater Facilities (0), Fish Creek Facilities (3), Lemolo 2 Forebay/Canal (-7), Slide/Soda Facilities (10), Clearwater Transmission Line (1), Lemolo 1 Powerhouse to Lemolo Lake (7), Transmission Line between Toketee Switching Station and Lemolo 2 Powerhouse (9), Transmission Line between Lemolo Powerhouses (14), Transmission Line BLM Ownership (18), Toketee Lake Facilities (16), and Transmission Line West of Toketee Switching Station (40).

In 2015, the highest density of infestations (number of infestations per acre by Project section) occurred in the Transmission Line BLM Ownership Project section (1.0 infestation per acre). Since 2012, the weed infestation density of this Project section has increased from 0.86 infestations per acre.

At 0.03 infestations per acre, the Lemolo 1 Powerhouse to Lemolo Lake Project section had the lowest density in 2015, which is partly due to the very large size of that section (689 acres). Figure 3-1 presents a visual comparison of infestations per acre by Project section in 2012 and 2015. The complete list of infestations and acreages for 2015 is presented by species and Project section in Table A-6 of Appendix A.

Figure 3-1. Noxious weed infestations per acre by Project section in 2012 and 2015 (Project sections from west to east).



As shown in Figure 3-1, the trend in all but one Project section is an increase in the number of infestations per acre. The largest increases in density occurred within the following Project sections: Transmission Line BLM Ownership, Slide/Soda Facilities, Transmission Line between Toketee Switching Station and Lemolo 2 Powerhouse, Transmission Line West of Toketee Switching Station, and Toketee Lake Facilities.

4.0 Discussion

The 2015 field effort was an inventory of old and new noxious weed infestations at Project-related developments. Project areas range in elevation from 850 feet to 4,400 feet. The trends in noxious weed infestations between 2012 and 2015 are described in Section 4.1. Information and recommendations pertaining to the prevention and control are described in Section 4.2, and conclusions are presented in Section 4.3.

4.1 Trends in Noxious Weed Infestations

In 2015, there were 113 more infestations than 2012, a 14% increase. While there were 284 new infestations, there were 480 previously recorded infestations (either 2012 or historical) that were not observed during the 2015 inventory. Interestingly, the overall infestation area actually decreased by 0.5-acre (or 0.3%) between 2012 and 2015, suggesting that the new infestations are relatively small and have recently colonized the Project area. The Project sections with the most number of new infestations are Transmission Line West of Toketee Switching Station (86) and Transmission Line BLM Ownership (43), Toketee Lake Facilities (33), Lemolo 2 Forebay/Canal (29), and Slide/Soda Facilities (29). The remaining Project sections had between four and 19 new infestations.

Out of the 284 newly discovered infestations, 93 (33%) were not mature at the time of the 2015 inventory. These infestations make good candidates for treatment, with the goal being to treat the infestations early in the season, before they mature and set seed. This approach will help minimize the probable growth and spread of these young infestations.

Seventy-three existing infestations have expanded in size since the 2012 inventory. Approximately seventy-five percent of these expansions occurred within the Transmission Line West of Toketee Switching Station (35) and Transmission Line BLM Ownership (18) Project sections. In contrast, 20 existing infestations have decreased in size since the 2012 inventory, limited to Scotch broom (10), meadow knapweed (8), and Himalayan blackberry (2). These decreases reflect the treatment efforts that have taken place over the last three years. However, these three species also account for the highest number of new and expanded infestations, by far. This indicates that while treatment efforts can have an effect on specific infestations, existing infestations will continue to set seed and expand into new areas. As stated above, treatment efforts should be timed to occur before the target species have had a chance to mature and set new seed.

In 2015, the two lowest elevation Project sections (Transmission Line BLM Ownership and Transmission Line West of Toketee Switching Station) had the highest number of infestations

overall, including new and expanded infestations. For the Transmission Line West of Toketee Switching Station Project section, this result is partly explained by the fact that it is the second largest section in the Project area. The largest Project section, Lemolo 1 Powerhouse to Lemolo Lake, only contained 2% of the total number of infestations—this high elevation Project section receives less traffic than the lower elevation Project sections, but the public campground around Lemolo Lake somehow remains largely weed-free.

Lower elevation Project sections, particularly on BLM-owned lands, are in proximity to rural residential and commercial development. Thus, the public is using roads that intersect Project sections in the lower elevations of the Project. A larger number of users contribute to the dispersal of noxious weed seed into and out of the inventory area. Further evidence of human-caused dispersal is the density of infestations in and around the Toketee Campground and Toketee Control Center.

Even in areas where public access is limited by gated access roads, vehicle dispersion of weeds is an issue. Species such as medusahead rye, Scotch broom, and meadow knapweed are abundant on unimproved roads (e.g., in the Transmission Line West of Toketee Switching Station Project section). Any vehicles using these roads likely aid seed dispersal and expand the range of species infestations. Vehicle traffic on access roads throughout the Project area is a necessary part of Project operation and maintenance, but it poses a recurrent risk for spreading noxious weeds.

4.2 Prevention and Control

PacifiCorp strives to prevent the establishment and spread of noxious weeds in the Project boundary. Best management practices (BMPs) listed in the VMP include the following:

- Training to encourage weed awareness and prevention efforts among Project and contractor staff.
- Planning and scheduling construction and maintenance activities prior to seed set or after seed dispersal.
- Cleaning machinery and other equipment.
- Minimizing ground disturbance, particularly in riparian areas.
- Revegetating after ground-disturbing activities.

The results of the weed inventories, including maps and reports, should be used to guide the implementation of these BMPs, where appropriate.

PacifiCorp, the USFS, and the BLM are actively implementing control efforts to eradicate infestations and limit the spread of noxious weeds. Eradication is difficult for most species, as evidenced by the persistence of Himalayan blackberry, spotted knapweed, and Scotch broom

infestations. Specific recommendations (in addition to those already in the VMP) for control of infestations that should be considered for implementation include the following:

- Evaluate routine Project access requirements along access roads and determine if designated parking areas, pullouts, and turn-around areas can be treated and maintained free of noxious weeds in the more frequently used or more highly infested areas.
- Focus treatment along the most frequently used access roads including pullouts, parking areas, and turn-around sites. Create, maintain, and use parking sites that are kept free of noxious weeds to help limit vehicle-generated seed dispersal.
- Prioritize treatment of priority species with relatively few or small infestations in new areas, especially where roads, streams, or other dispersal pathways could lead to rapid invasion of new areas. Examples of species in this category include medusahead rye, yellow starthistle, meadow knapweed, spotted knapweed, and quackgrass.
- Routinely (e.g., annually) inspect treated areas for resprouting and retreat as appropriate. This includes follow-up inspections of solarization treatments to ensure that the cover is maintained and encompasses the entire infestation. Use this information to evaluate the effectiveness of different treatment methods by species and shift to the most effective methods for a given species.
- Prioritize treatment of infestations in locations where seed dispersal could occur over a wide area. This includes the reed canarygrass infestation (PHAR-10) at the Lemolo 2 Forebay and Canada thistle (CIAR-24) at the east end of Toketee Lake, which could provide enough seed to colonize all the surrounding wetlands.
- For widely distributed species (e.g., Scotch broom), focus on small infestations in areas of concern and areas where low numbers of infestations make eradication possible (e.g., CYSC-241 and -242).

Age class information (Appendix C) collected again in 2015 will help track the trends relative to treatment timing and methods, as well as the capacity for infestations to act as seed sources. Age class information may also be used for management planning, and future planning efforts to prevent and control infestations should incorporate age class information. Immature infestations should be targeted for treatment early in the season before they have a chance to mature and set new seed.

The 2015 inventory illustrates the need for stakeholders to coordinate databases used to store data on infestations and treatments. Stakeholder data need a common identifier to facilitate relationships between databases. Consistent use of GPS equipment and associated data management and quality control processes by PacifiCorp, USFS, and BLM field crews will continue to improve the ability to track and monitor treatments and infestations. Part of using a

standard dataset and management schema should include accurate mapping of all access roads, which would improve the accuracy of both future weed surveys and treatment applications.

A common data dictionary, such as the one used by PacifiCorp in 2012 and 2015, would improve data consistency among agency weed crews and PacifiCorp. Weed crews should use the data dictionary and the weed inventory database in the field to identify the known infestations that are being treated. Consistent treatment data will also yield stronger correlations between infestations and long-term treatment effectiveness.

4.3 Conclusions

In 2015, there were 907 active noxious weed infestations covering all Project sections in the inventory area. PacifiCorp, working with the USFS and BLM, continues to limit the establishment and spread of noxious weeds in the North Umpqua Hydroelectric Project boundary. With treatment efforts, results from the 2015 Noxious Weed Inventory are mixed– infestations have increased in number (113) but decreased in size (0.4 acre) between 2012 and 2015. There were 284 newly mapped infestations in 2015, but they only account for 3.3 acres (2.3%) of total infestation area.

Treatment for most species should continue, with a more concerted focus on keeping access roads clear of noxious weeds to minimize the spread by vehicle traffic (see Section 4.2). Weed crews should use the weed inventory to assign existing Site_IDs to treatment data collected during field efforts.

Periodic inventories on a 3-year schedule will continue to provide useful information about terrestrial noxious weed populations in the inventory area. Projects such as the 2015 Noxious Weed Inventory generate valuable data and provide an opportunity to explore areas for improved management. Geospatial technologies, including GPS and GIS, are valuable tools for improved noxious weed identification and management. The use of these technologies was introduced in 2009 and has been invaluable for efficient data collection, analysis, and output for the 2015 Noxious Weed Inventory.

Table A-2. ODA classification definitions.

ODA Classification Definitions	
A	Weed of known economic importance which occurs in the state in small enough infestations to make eradication/containment possible; or it is not known to occur, but its presence in neighboring states makes future occurrence seem imminent
B	Weed of known economic importance that is regionally abundant, but may have limited distribution in some counties. Where implementation of a fully integrated statewide management plan is infeasible, biological control shall be the primary control approach for B listed weeds.
T	"Targeted" weeds are priority weeds designated by the Oregon State Weed Control Board for focused control efforts.

Table A-3. USFS noxious weed ratings.

USFS Rating	
A	An aggressive, non-native species of limited distribution on the UNF. These species would be subject to intensive control or eradication where feasible.
B	An aggressive, non-native species that is too widely distributed on the UNF to be efficiently treated by currently available intensive control methods. Isolated infestations and infestations threatening specific resource damage may be subject to intensive controls. Populations at large would be subject to less intensive methods such as biological controls or vegetative competition.
D	An aggressive, non-native species that has not yet been detected on the UNF but whose current distribution and ecological requirements suggest potential for movement onto the Forest. Any occurrences of these species discovered on the Forest would be subject to intensive control methods and the species would be elevated to the "A" list.

Map sheet weed label format:

Site_ID (Density, Cover)

Site Identifier consists of the Species Code plus sequential population number.
e.g., Cytisus scoparius infestation #1 has a SITE_ID of CYSC-1.

Density Code (abundance of plants in polygon)
1 <10 plants
2 10-100 plants
3 101-1,000 plants
4 >1,000 plants

Aerial Cover Code
T (Trace) <1%
L (Low) 1-5%
M (Moderate) 5.1-25%
H (High) 25.1-100%

Species Code	Scientific Name	Common Name
AGRE	Elymus (syn. Agropyron) repens	Quackgrass
CAPY	Carduus pycnocephalus	Italian plumeless thistle
CEDI	Centaurea diffusa	Diffuse knapweed
CEMA	Centaurea stoebe (syn. maculosa)	Spotted knapweed
CEPR	Centaurea debeauxii (syn. pratensis)	Meadow knapweed
CESO	Centaurea solstitialis	Yellow starthistle
CHJU	Chondrilla juncea	Rush skeletonweed
CIAR	Cirsium arvense	Canada thistle
CIVU	Cirsium vulgare	Bull thistle
CRMO	Crataegus aquifolium	English hawthorn
CYSC	Cytisus scoparius	Scotch broom
HEHE	Hedera helix	English ivy
HYPE	Hypericum perforatum	St. Johnswort
ILAQ	Ilex aquifolium	English holly
LIVU	Linaria vulgaris	Yellow toadflax
PHAR	Phalaris arundinacea	Reed canarygrass
PORE	Potentilla recta	Sulfur cinquefoil
POSA	Polygonum sachalinense	Giant knotweed
RUDI	Rubus armeniacus (syn. discolor)	Himalayan blackberry
SEJA	Senecio jacobaea	Tansy ragwort
TACA	Taeniatherum caput-medusae	Medusahead rye

DATA SOURCE:
2015 noxious weed infestation polygons are the product of the 2015 Noxious Weed Inventory project; PacifiCorp Geodatabase[PC_NoxWeed_2015.mdb], feature class
Map features, including facility buildings, transmission line towers, roads, streams, and waterbodies are derived from PacifiCorp Geodatabase [PC_Background_Data.gdb], including annotation.
Overview Map base draws from ESRI data (CD).

Appendix C
2015 Noxious Weed Inventory Data Records

2015 Weed Survey Geodatabase Data Field Descriptions

Field Name	*Description*
GID	Unique identifier of record
SITE ID	Site identifier derived from the first two letters of the genus and the first two letters of the species, followed by a sequential population number (e.g., Scotch broom [*Cytisus scoparius*], infestation #1 has a SITE_ID of CYSC-1).
2015 STATUS	Status of infestation. For 2015 records: C (2012 infestations observed in 2015 that changed with respect to in counts and/ or cover since 2012); NC (No change since 2012); New (New infestation observed in 2015); New-ex (2015 infestation expanded in size since 2012); New-ex_C (Infestation that expanded in 2015 and overlapped adjacent infestations); New-dec (2015 infestation decreased in size since 2012); NO (2012 infestation with no plants in 2015 or infestation included in BLM or USFS treatment data that was not observed during the 2015 survey); NO_A (2012 infestation that was absorbed by an adjacent infestation in 2015 and is no longer tracked as a unique infestation); NS (Infestation not inventoried) – assume attributes of previous inventory.
2012 STATUS	Status of infestation in 2012: C (2009 infestations observed in 2012 that changed with respect to in counts and/ or cover since 2009); NC (No change since 2009); New (New infestation observed in 2012); New-ex (New 2012 infestation expanded in size since 2009); New-dec (New 2012 infestation decreased in size since 2009); NO (2009 infestation with no plants in 2012); NS (Infestation not inventoried) – assume attributes of previous inventory.
2009 STATUS	Status of infestation in 2009: C (2006 infestations observed in 2009 that changed with respect to in counts and/ or cover since 2006); NC (No change since 2006); New (New infestation observed in 2009); New-ex (New 2009 infestation expanded in size since 2006); New-dec (New 2009 infestation decreased in size since 2006); NO (2006 infestation with no plants in 2009); NS (Infestation not inventoried) – assume attributes of previous inventory.
2006 STATUS	Status of infestation in 2006: C = 2003 infestations with existing infestation that changed with respect to in counts and/ or cover since 2003; NC = existing infestation assessed to have no changes since 2003; new = new infestation observed in 2006; new-ex = 2006 infestation that expanded in size since 2003; new-dec = 2006 infestation that decreased in size since 2003; NO = 2003 infestations at which no plants were observed in 2006. The count and cover estimates from 2003 were assumed to apply to 2006 even though no plants were observed. This was done to provide tracking for future surveys in case plants were missed in 2006 or possibly temporarily removed but not eradicated during possible control efforts. Future survey and assessment of these sites will confirm the potential disappearance of these infestations.; NS = Not surveyed in 2006 due to access and/or timing issues. These infestations were assumed to have remained unchanged since 2003. It was assumed that 2003 estimates for counts and cover are maintained until future survey and assessment can confirm status.; inc = 2003 infestations included within “new-ex” infestations in 2006; exc = 2003 infestations excluded reduced (new-dec)in size in 2006 - see (PacifiCorp 2007)

2015 Weed Survey Geodatabase Data Field Descriptions

Field Name	*Description*
2015 LABEL	Label used to identify the active and historic weed infestations as of the 2015 field weed inventory. The label is composed of the Site ID, density, and cover of the infestation. In the 2015 weed inventory mapset, active infestations are labeled in black font and historic infestations are labeled in grey font.
NOXIOUS WEED	Species Common Name
NOXIOUS WEED SCIENTIFIC NAME	Species Scientific Name - To remain consistent with naming conventions for SITE_IDs from previous inventories, the 2015 inventory continued to use older scientific names
SPECIES CODE	Species Code - derived from the first two letters of the genus and the first two letters of the species
AGE CLASS	Age Class of infestation: Seedling; Immature; 1st Year; Mature; Senescent.
ABUNDANCE	Density (Abundance) of plants in infestation polygon: 1: <10 plants; 2: 10-100; 3: 101-1,000; 4: >1,000 plants.
COVER	Areal cover of plants in infestation polygon: Trace (T) = <1%; Low (L) = 1-5%; Moderate (M) = 5.1-25%; High (H) = 25.1-100%.
MAP SHEET	Mapsheet number upon which the infestation occurs
OBSERVED TREATMENT	Treatment observed in the field during the 2015 inventory. YES = Infestation appeared to be treated, but the type of treatment could not be discerned in the field. YES-USFS = Treatment was not observed in the field, but treatment records received from the USFS indicated that infestation was treated. NONE = No treatment was observed in the field, nor treatment records provided for that infestation. All other entries = the type of treatment observed during the field survey.
PROJECT SECTION	Project section within which the infestation is located. 2015 records used the "PC_NOX_PROJ_SECTIONS_2015" shapefile which is based on the 2015 FERC Project boundary.
ACRES	Acreage of infestation polygon
