

PacifiCorp - Stakeholder Feedback Form

2019 Integrated Resource Plan

PacifiCorp (the Company) requests that stakeholders provide feedback to the Company upon the conclusion of each public input meeting and/or stakeholder conference calls, as scheduled. PacifiCorp values the input of its active and engaged stakeholder group, and stakeholder feedback is critical to the IRP public input process. PacifiCorp requests that stakeholders provide comments using this form, which will allow the Company to more easily review and summarize comments by topic and to readily identify specific recommendations, if any, being provided. Information collected will be used to better inform issues included in the 2019 IRP, including, but not limited to the process, assumptions, and analysis. In order to maintain open communication and provide the broader Stakeholder community with useful information, the Company will generally post all appropriate feedback on the IRP website unless you request otherwise, below.

Date of Submittal 7/28/2018

*Name: Kevin Emerson

Title: Energy Efficiency Program Director

*E-mail: kevin@utahcleanenergy.org

Phone: 801-903-2029

*Organization: Utah Clean Energy

Address: [Click here to enter text.](#)

City: [Click here to enter text.](#)

State: [Click here to enter text.](#)

Zip: [Click here to enter text.](#)

Public Meeting Date comments address: 7/23/2018

Check here if not related to specific meeting

List additional organization attendees at cited meeting:

***IRP Topic(s) and/or Agenda Items:** List the specific topics that are being addressed in your comments.

Flexible Reserve Study

Check here if any of the following information being submitted is copyrighted or confidential.

***Respondent Comment:** Please provide your feedback for each IRP topic listed above.

How does AEG weight the UEC baseline to represent varying levels of energy efficiency among the measures included in the measure saturation data? For example, for the central AC measure what is the assumed percentage of central ACs that are highly efficient, meet the current federal minimum standards, or are older units that are less efficient than the current federal standards?

On the July 23rd webinar AEG stated that they assume that measures are replaced annually based on the lifetime of the measure. In the example they provided, central ACs have an average life of 15 years, so they assume that 1/15 of the central ACs in operation will be replaced each year. When equipment of any type is replaced in AEG's modeling, what level of energy efficiency is assumed for the replacement measure? Does the AEG model assume that replacement measures meet the federal minimum standard or the most efficient model available?

This information will help us understand how the baseline study and measure list, etc. inform the development of the technical potential.

Data Support: If applicable, provide any documents, hyper-links, etc. in support of comments. (i.e. gas forecast is too high - this forecast from EIA is more appropriate). If electronic attachments are provided with your comments, please list those attachment names here.
