Glossary of Terms

Analysis of Covariance (ANCOVA)
An ANCOVA model is an ANOVA model with a continuous variable added.

Analysis of Variance (ANOVA)
An ANOVA model explains the variation in the independent variable, based on a series of characteristics (expressed as binary variables with values of either zero or one, indicating the absence or presence of the characteristics).

Coefficient of Determination ($R^2$)
The $R^2$ indicates the proportion of variance in a dependent variable explained by a regression equation, and takes values between zero and one. An $R^2$ of zero indicates that the independent variables have no explanatory power. An $R^2$ of one indicates that 100% of the variability in the dependent variable is explained by changes in the independent variables.

Evaluated Gross Savings
Evaluated gross savings are the total savings resulting from a program, before adjusting for freeridership or spillover. They are most often calculated for a given measure, ‘i,’ as:

\[ \text{Evaluated Gross Savings}_i = \text{Verified Participation}_i \times \text{Unit Consumption}_i \]

Evaluated Net Savings
Evaluated net savings are the total savings resulting from a program, net of what would have occurred in the program’s absence. These savings can be attributed to the program and are calculated as:

\[ \text{Net Savings} = \text{Evaluated Gross Savings} \times \text{Net to Gross} \]

Freeridership
Freeridership in energy-efficiency programs represents participants who would have adopted the energy-efficient measure in the program’s absence. This is often expressed as the freeridership rate, or the proportion of evaluated gross savings that can be classified as freeridership.

Gross Unit Energy Savings
For the SYLR program, gross unit energy savings are the evaluated in situ unit energy consumption for the recycled unit, adjusted for part-use.

In-Service Rate (ISR)
The ISR (also called the installation rate) is the proportion of incented measures actually installed.

Net-to-Gross (NTG) Ratio
The NTG ratio is a ratio of net savings to gross savings. Analytically, NTG is defined as:

\[ \text{NTG ratio} = \frac{\text{Net savings}}{\text{Gross savings}} \]
**Realization Rate**
The realization rate is a comparison of evaluated gross savings to reported savings.

**P-Value**
A p-value indicates the probability that a statistical finding might be due to chance. A p-value less than 0.10 indicates that, with 90% confidence, the finding is statistically significant.

**Part-Use Factor**
The part-use factor is the portion of the year that equipment operates. That is, if a given measure has a part-use factor of 0.5, it operates for six months out of the year, on average.

**Spillover**
Spillover is the adoption of an energy efficiency measure induced by the program’s presence, but not directly funded by the program. As with freeridership, the spillover rate is expressed as a proportion of evaluated gross savings.

**T-Test**
The t-test is a general statistical test of difference. In regression analysis, a t-test is applied to determine whether the estimated coefficient differs significantly from zero. A t-test with a p-value less than 0.10 indicates a 90% probability that the estimated coefficient is different from zero.
Executive Summary

Rocky Mountain Power contracted with Cadmus to conduct an impact and process evaluation of its See ya later, refrigerator® (SYLR) Program for the 2013 and 2014 program years. To evaluate program gross and net energy savings for the impact evaluation, Cadmus used secondary meter data analysis, surveys of program participants, and a review of the program tracking data. In evaluating the effectiveness of program processes, Cadmus conducted in-depth interviews with program staff involved in different aspects of the program.

The evaluation data consisted of the following:

- Telephone surveys with 117 participating Idaho customers;
- Reviews of Idaho program materials; and
- In-depth interviews with program management and program administrator staff.

At the time of this report submission, the program implementer JACO Environmental had ceased operations, and Rocky Mountain Power subsequently canceled the program in January 2016.

Key Impact Findings

The impact evaluation produced the following key findings:

- In 2013, the SYLR Program recycled 566 refrigerators and freezers; in 2014, participation increased slightly to 617. Over those two years, the program distributed 1,087 kits. In total, the program achieved 1,273,559 kWh in evaluated gross savings over the two-year period, or 95% of the 1,345,304 kWh reported gross savings.
- The part-use factor (i.e., the portion of the year that the equipment operated) fell within expected ranges: 0.92 for refrigerators and 0.87 for freezers. This part-use factor served as a component of the gross per-unit savings calculation.
- After adjusting for part-use, gross per-unit savings were 1,098 kWh for refrigerators (up from 1,022 in 2011–2012) and 829 kWh for freezers (down from 1,033 in 2011–2012). Neither gross savings estimate were statistically differed from the 2011–2012 evaluation estimates.
- Net per-unit savings were 456 kWh for refrigerators and 235 kWh for freezers—lower values than the evaluated per-unit savings for 2011–2012.\(^1\) This decline primarily occurred due to a large proportion (roughly 45%) of survey respondents indicating that, absent the program, they would have disposed of their appliance in a way that would have permanently removed it from the grid compared to 30% in 2011–2012.

---

\(^1\) Evaluated per-unit net savings in the 2011–2012 evaluation were 550 kWh for refrigerators and 492 kWh for freezers, with NTGs of 54% and 48%, respectively.
• Evaluated savings for energy savings kits also declined, primarily due to a decrease in evaluated hours of use. Over the two years, the kits achieved 45,709 kWh in evaluated net savings, and 81% of the 56,496 reported gross savings.
• Overall net-to-gross (NTG), including energy savings kits, decreased from 52% in the 2011–2012 evaluation to 41%. The current program evaluation found high freeridership levels due to 45% of respondents claiming they would have disposed of their units without the program.

Table 1 summarizes evaluated program participation, reported gross savings, and evaluated gross and net savings for 2013 and 2014.\(^2\) Evaluated total net savings for the program were lower than reported total savings due to the lower NTG ratio. Table 2 and Table 3 show the 2013 and 2014 program information, respectively.

### Key Process Findings

The process evaluation produced the following key findings:

- Collaboration between Rocky Mountain Power and the program administrator proved effective due to a longstanding working relationship. Program staff reported effective communication and smooth implementation.

- Participant satisfaction remained high during the 2013 and 2014 program years: 100% of surveyed participants reported being very satisfied or somewhat satisfied with the program, and 99% of surveyed participants also expressed satisfaction with the contractor who picked up their units for recycling. The survey did not reveal notable customer complaints.

- Participants learned of the program through various channels, with the following sources most common: bill inserts, word-of-mouth, television, retailers, and the Rocky Mountain Power website. The source of awareness with the largest increase from the previous evaluation was the utility website (9%, up from 3%); the percentage of participants enrolling online also increased (29% in 2014, up from 19% in 2013).

- The program implementer improved tracking of the energy savings kits delivered through the program, tracking orders at multiple phases and ultimately recording which customers received kits and which refused the kits. This increased the verified delivery rate from the 2011–2012 evaluation period.

### Cost-Effectiveness Results

As shown in Table 4, the program proved cost-effective across the evaluation period for all of the cost-effectiveness test perspectives, except the Ratepayer Impact Measure test (RIM). The Participant Cost test (PCT) benefit/cost ratio could not be calculated because there were no costs associated with this test perspective.

The 2013–2014 program was cost-effective with a benefit/cost ratio of 1.14 from the Total Resource Cost (TRC) test perspective. Evaluated net savings for 2013 and 2014 were approximately 20% and 23% lower than net savings used in the annual report analyses. This resulted in a reduction in the benefit-cost ratios from the 2013 and 2014 annual reports of 1.48 and 1.40, respectively, for the TRC test.

Summary and Recommendations

Although participation fell slightly for 2013 and 2014 (compared to 2011 and 2012), the SYLR Program ran smoothly, did not encounter major implementation issues, and experienced high customer satisfaction rates. The program achieved net savings of 528,205 kWh over the two-year period in a cost-effective manner, despite an increase in freeridership rates.

Based on the evaluation results, Cadmus offers the following recommendations if the program were to be reinstated in the future:

- Rocky Mountain Power should consider adjusting its expected per-unit savings to reflect evaluated per-unit gross savings values of 1,098 kWh for refrigerators, 829 kWh for freezers, and 42 kWh for kits across both years (as found in this evaluation).
- For future cost-effectiveness calculations, Cadmus recommends that Rocky Mountain Power update measure lives to align with values adopted in the most recent Regional Technical Forum (RTF) measure workbooks as follows: 6.4 years for refrigerator recycling, 5.2 years freezer recycling, and 7.4 years for the CFLs in the energy-saving kits.

---

3 On January 27, 2016, Rocky Mountain Power filed Case No. PAC-E-16-04 to permanently cancel the ID SYLR program.

4 The RTF is an advisory committee in the northwest that develops standards to verify and evaluate conservation savings.

5 http://rtf.nwcouncil.org/measures/res/ResFridgeFreezeDecommissioning_v4.xlsm

6 http://rtf.nwcouncil.org//measures/res/ResLighting_Bulbs_v4_2.xlsm
Program Description and Overview

The Idaho See ya later, refrigerator® (SYLR) customer refrigerator and freezer recycling program served as part of Rocky Mountain Power’s demand-side management (DSM) resource acquisition strategy. Rocky Mountain Power’s overarching objective with the program was to decrease electricity usage (kWh) by removing and recycling inefficient freezers and refrigerators. In addition to reducing energy consumption and lowering participants’ electricity consumption, participating appliances were recycled in an environmentally sound manner.

In operation since 2005, the SYLR program provided customers with a $50 incentive for each qualified recycled appliance. Participants received an incentive for up to two refrigerators or freezers per year. Renters who owned their appliances could participate, and apartment complex owners or managers who provided tenants with appliances were eligible. Participants also received a free energy-saving kit, which included: two 13-watt CFLs, a refrigerator/freezer thermometer card, energy-savings educational materials, and information on other Rocky Mountain Power efficiency programs. The program logic model is presented in Appendix D. Starting July 1, 2014, business customers were also able to recycle qualifying units through the program, as well as participating retailer pickups.

Qualifying refrigerators and freezers had to be in working condition when picked up and between 10–32 cubic feet in size utilizing inside measurements. Rocky Mountain Power contracted with JACO Environmental, Inc. (the program administrator) to implement the program in Idaho and in the rest of PacifiCorp territory. The program administrator disabled and removed the appliances, and recycled at least 95% of the materials, including the refrigerant.

Program Participation

Participation in appliance recycling programs (ARPs) tends to be seasonal, with the highest participation during summer and declining into winter. As shown in Figure 1, participation in the SYLR Program in both years saw an increase in the number of units picked up through summer and into the fall, with a drop off in September followed by an increase in October.

---

7 See ya later, refrigerator® has been registered to PacifiCorp through the U.S. Patent and Trademark Office since April 6, 2010, under registration number 3770705.

8 Environmentally-sound disposal of this equipment includes: proper disposal of oils, polychlorinated biphenyls (PCBs), mercury, and chlorofluorocarbon-11 (CFC-11) from foam; and recycling of CFC-12, hydrofluorocarbon-134a (HFC-134a), plastic, glass, steel, and aluminum.
Figure 1 shows the program’s nine-year trends in program unit age and size. During this period, average sizes for both appliance types displayed an upward trend, though freezer size dropped in 2014. Average unit ages peaked in 2010. Average ages for both appliance types remained relatively similar after declining in 2011, until 2014 when average freezer age declined.

The refrigerator configurations of program units also changed, with fewer top freezer units and more side-by-sides as the program matured, as shown in Figure 3.
As shown in Figure 4, there has been a general decrease in upright configurations over time, with some variations between years.
These trends generally remained consistent with Cadmus’ observations of other recycling programs. As recycling programs mature, the composition of recycled appliances tends to change. In their infancy, the programs recycle more secondary appliances (particularly those in use for only a portion of the year). Such units tend to be smaller and located in unconditioned spaces, such as garages or basements. They also tend to be less efficient.

The average age of appliances also tends to decrease as programs mature, though this did not appear to be the case with the Idaho SYLR program, which saw a slight increase in the average age over time. This could have resulted from the relatively small size of the program, where a few units could skew the average between years. Another factor could have been the rural nature of the service territory, without urban centers with higher volumes of new units purchased each year, and lower population turnover leading to longer-established households that hang on to units longer; the program picked up older units as more households became aware of the program.
Impact Evaluation

Methodology
This report presents two types of evaluated savings: evaluated gross savings and evaluated net savings. To determine these values, Cadmus applied the four steps shown in Table 7. The evaluation defined reported savings as electricity savings (kWh) that Rocky Mountain Power included in its 2013 and 2014 annual reports.

| Table 7. Impact Estimation Steps |
|-------------------------------|-----------------|------------------|
| Saving Estimate               | Step | Action                                                      |
| Evaluated Gross Savings       | 1    | Verify accuracy of data in program database                 |
|                               | 2    | Perform statistical/engineering analysis to evaluate per-unit savings |
|                               | 3    | Adjust evaluated gross savings with installation rate/part-use factor |
| Evaluated Net Savings         | 4    | Apply NTG adjustments                                        |

- **Step one** (verifying the accuracy of data in the program database) included reviewing the program tracking database to ensure reported participation and savings matched the 2013 and 2014 annual reports.
- **Step two** (performing a statistical/engineering analysis to evaluate per-unit savings) estimated refrigerator, freezer, and CFL savings.
- **Step three** (adjusting the evaluated gross savings with the installation rate/part-use factor) determined the mean proportion of the year in which recycled appliances were used as well as the number of CFLs program participants installed. Using a telephone survey, Cadmus collected information to estimate an installation rate and a part-use factor, which Cadmus then used to calculate evaluated gross savings.
- **Step four** (applying NTG adjustments) determined the net savings. Through participant telephone surveys, Cadmus estimated freeridership, secondary market effects (i.e., the program’s impact on the availability of used appliances), spillover, and induced replacement.9

Sampling Approach
Cadmus developed survey samples of randomly selected program participants, seeking a precision of ±10% at the 90% confidence level for the measure level. The evaluation determined sample sizes, assuming a 0.5 coefficient of variation). Cadmus applied a finite population correction to determine the necessary sample size. Table 8 shows planned and achieved sample sizes by target group.

---
9 This report’s Net-to-Gross section provides a detailed description of Cadmus’ process for estimating these parameters.

*Because fewer participants recycled freezers than refrigerators, if a participant recycled both a refrigerator and a freezer, they were only included in the freezer sample to avoid contacting the same participant more than once.

Cadmus randomly completed 117 participant surveys from the population of 1,094 unique participants. Participant surveys were conducted in one round during summer 2015.

**Uniform Methods Project**

This evaluation follows the methodology described in the Uniform Methods Project (UMP) refrigerator recycling protocol. The Department of Energy’s website\(^\text{10}\) provides more information about the UMP.

**Kit Savings Algorithm and Assumptions**

With each pickup ordered, participants could receive an energy-saving kit, containing the following:

- Two 13-watt CFLs
- One refrigerator thermometer
- Energy-savings educational materials and other program references

Cadmus used the following algorithm to estimate CFL savings:

\[
Evaluated \text{ Per Unit Savings (kWh per unit)} = \frac{\Delta \text{Watts} \times \text{ISR} \times \text{HOU} \times \text{WHF} \times 365.25}{1,000}
\]

Where:

- \(\Delta \text{Watts}\) = Wattage of baseline bulb - Wattage of kit CFL
- ISR = In-service rate or the percentage of CFLs installed
- HOU = Hours of use; per day
- WHF = Waste heat factor, an adjustment to account for lighting impacts on HVAC consumption
- 365.25 = Constant; days per year
- 1,000 = Constant; conversion of watts to kilowatts

The ISR captured CFLs installed, removed, and replaced by other energy-efficient light bulbs:\textsuperscript{11}

\[
CFL\ In - \ Service\ Rate\ (ISR\ %) = \frac{\text{Installed} - \text{Removed or Replaced}}{\text{Reported}}
\]

Cadmus used the lumens equivalence method to determine delta watts consistent with the methodology prescribed by the UMP.

Delta watts represents the wattage difference between a baseline bulb and an equivalent CFL. Cadmus estimated the baseline wattage for kit bulbs by mapping bulbs to the ENERGY STAR bulb database to determine the bulb’s lumens output.

Cadmus assumed the bulb light output landed the bulb in the 800–1,099 lumens bin, which lead to the 2013 baseline of 60 W in the column “Baseline (Exempt Bulbs) (c)” and the 2014 baseline of 43 W from the column “Baseline (Post-EISA) (d)” in the UMP guidelines.\textsuperscript{12}

Cadmus calculated average hours of use (HOU) using ANCOVA\textsuperscript{13} model coefficients, estimated from a combined multistate, multiyear database of light logger data, and compiled by recent Cadmus CFL HOU studies. This model expressed average HOU as a function of room type. Appendix G provides a more detailed exploration of the impact methodology used to estimate CFL HOU.

\textit{Evaluated Gross Savings}

\textbf{Gross Annual Unit Energy Consumption}

Cadmus used the UMP-specified regression model to estimate unit energy consumption (UEC) for refrigerators, and used a similar model, developed outside of UMP, to estimate freezer UEC. The coefficient of each independent variable indicated the influence of that variable on daily consumption. Holding all other variables constant:

- A positive coefficient indicated an upward influence on consumption.
- A negative coefficient indicated a downward effect on consumption.

The value of the coefficient indicated the marginal impact of a one-point increase in the independent variable on the UEC. For instance, a 1-cubic foot increase in refrigerator size resulted in a 0.059 kWh increase in daily consumption.

\textsuperscript{11} Cadmus did not adjust the installation rate to account for lamps that burned out, as the failure rate was accounted for in the measure life assumptions.

\textsuperscript{12} See Table 2 on page 6-12 for 60 watt baselines:

\textsuperscript{13} ANCOVA, or analysis of covariance, refers to a type of statistical modeling.
For dummy variables, the value of the coefficient represented the difference in consumption if the given condition was true. For example, in Cadmus’ refrigerator model, the coefficient for the variable indicating whether a refrigerator was a primary unit equaled 0.560; this meant, all else being equal, a primary refrigerator consumed 0.560 kWh more per day than a secondary unit.

Refrigerator Regression Model
Table 9 shows the UMP model specification Cadmus used to estimate annual energy consumption of refrigerators recycled in 2013 and 2014, along with the model’s estimated coefficients.

*CDDs and HDDs derived from the weighted average from Typical Meteorological Year (TMY3) data for weather stations that Cadmus mapped to participating appliance zip codes. TMY3 used median daily values for a variety of weather data collected from 1991–2005.

To estimate the average annual UEC, Cadmus applied the model coefficients to the independent variables. For example, using values from Table 10 and Table 11, the estimated annual UEC for freezers could be calculated as:

\[
\text{Freezer UEC} = 365.25 \text{ days} \\
\times (-0.955 + 0.045 \times [30.76 \text{ years old}]) + 0.543 \\
\times [71\% \text{ units manufactured pre} - 1990] + 0.12 \times [17.97 \text{ ft.}^3] + 0.298 \\
\times [30\% \text{ units that are chest freezers}] - 0.031 \times [16.17 \text{ HDDs}] + 0.082 \\
\times [0.61 \text{ CDD}] = 953 \text{ kW h}
\]

Kit Savings
Table 12 shows final inputs and gross savings estimated for CFLs distributed in the energy-saving kits.
Table 12. Unadjusted CFL Savings (Not Including Adjustment for In-Service Rate)

<table>

<td>36</td>
</tr>
</tbody>
</table>

The lower HOU value of 1.80 for CFLs in 2013–2014 was likely due to increased saturation of efficient bulbs. As the efficient lighting market matures and saturation increases within the average home, efficient lamps are installed not just in high-use sockets but also in lower-use sockets, whether in rooms with lower usage or as supplemental lighting, such as desk lamps.

The survey responses indicated changes in the proportion of bulbs installed in various rooms between the 2011–2012 cycle and the current evaluation. The share of bulbs installed in living spaces (i.e., with a higher average usage) dropped from 28% in 2011–2012 to 17%. Conversely, the share of bulbs installed in room types designated as “other” (such as utility rooms, closets, hallways) increased from 19% in 2011–2012 to 27% in the current evaluation. These room types tended to have a lower average HOU.

UEC Summary

Table 13 reports the evaluated average annual UEC for refrigerators and freezers recycled through the SYLR Program during 2013 and 2014. The section following the table describes adjustments Cadmus made to these estimates to determine gross per-unit savings estimates for participant refrigerators and freezers.

*The metered sample of freezers was much smaller than the refrigerator sample used to estimate UECs because freezers accounted for a smaller proportion of program units nationally. Therefore, the freezer UEC estimates were not as precise.

**A weighted average of 2013 and 2014 kit savings without adjustments for installation rates.

In-Service Rates

Appliance Part-Use Factor

“Part-use” served as an adjustment factor specific to appliance recycling, used to convert a UEC into an average per-unit gross savings value. The UEC itself did not equal to the gross savings value, because:
• The UEC model yielded an estimate of annual consumption; and
• Not all recycled refrigerators would have operated year-round, had they not been decommissioned through the program.

The part-use methodology relied on information from surveyed customers regarding pre-program usage patterns, that is: how many months of the year prior to recycling was the appliance plugged in and running?

The final estimate of part-use reflected how appliances would likely operate had they not been recycled (rather than how they previously operated). For example, a primary refrigerator operating year-round could have become a secondary appliance and operated part-time.

The methodology accounted for such potential shifts in usage types. Specifically, part-use was calculated using a weighted average of the following prospective part-use categories and factors:

• Appliances that would have run full-time (part-use = 1.0)
• Appliances that would not have run at all (part-use = 0.0)
• Appliances that would have operated a portion of the year (part-use is between 0.0 and 1.0)

Cadmus calculated a weighted average part-use factor, representing the three participant usage categories, as defined by the appliance’s operational status during the year before recycling. For example, Cadmus gave participants who did not use their appliance at all during the year prior to its recycling a part-use factor of zero, as no immediate savings were generated by the appliance’s retirement.

Using information gathered through participant surveys, Cadmus took the following steps to determine part-use:

1. Cadmus determined whether recycled refrigerators were primary or secondary units (treating all stand-alone freezers as secondary units).
2. Cadmus asked participants who indicated they had recycled a secondary refrigerator or freezer if the appliance had operated year-round, operated for a portion of the preceding year, or was unplugged and not operated. Cadmus assumed all primary units operated year-round.
3. Cadmus asked participants who indicated they operated their secondary refrigerator or freezer for only a portion of the preceding year to estimate the total number of months that the appliance remained plugged in. This allowed the calculation of the portion of the year in which the appliance remained in use. Cadmus determined that the average refrigerator, operating part-time, had a part-use factor of 0.13, or around a month and a half. Freezers operating part time had a part use factor of 0.45, or five months.

These three steps resulted in information about how refrigerators and freezers operated prior to recycling, as shown in Table 14.

In many cases, the way an appliance was used historically (prior to recycling) did not indicate how the appliance would have been used, had it not been recycled. To account for this, Cadmus next asked surveyed participants how they would have (likely) operated their appliances, had they not recycled them through SYLR. For example, if surveyed participants indicated they would have kept a primary refrigerator in SYLR’s absence, Cadmus asked if they would have continued to use the appliance as their primary refrigerator or would have relocated it, using it as a secondary refrigerator.

Participants who said they would have discarded their appliance independent of the program were not asked about the future usage of that appliance, as that would be determined by another customer. Since the future use type of discarded refrigerators was unknown, Cadmus applied the weighted part-use average of all units (0.94) for all refrigerators that would have been discarded independent of the program. By using this approach, the team acknowledged that the discarded appliances could be used as primary or secondary units in the would-be recipient’s home.

Cadmus then combined the part-use factors shown in Table 14 with participants’ self-reported actions had the program not been available. This resulted in the distribution of likely future usage scenarios and corresponding part-use estimates.
The weighted average of these future scenarios, shown in Table 15, produced SYLR’s 2013–2014 part-use factor for refrigerators (0.92, up from 0.84 in 2011–2012) and freezers (0.87, down from 0.93 in 2011–2012).\(^\text{14}\)

Applying the part-use factors from Table 15 to the modeled annual consumption from Table 13 yielded the average gross per-unit energy savings. Table 16 shows the average gross savings for refrigerators was 1,098 kWh and savings for freezers were 829 kWh.

**CFL Installation Rate**

As part of the participant survey, Cadmus asked respondents how many bulbs they installed from those included in the energy savings kits. Overall, 87% of respondents installed both bulbs, while 6% did not install either, and 8% installed only one bulb (does not sum to 100% due to rounding).

On average, participants initially installed 1.8 of the two bulbs received, resulting in a 90% installation rate—above the 73% found in the 2011–2012 evaluation. Figure 5 shows the proportion of participants installing zero, one, or two bulbs.

\(^{14}\) As future usage of discarded refrigerators remained unknown, Cadmus applied the weighted average part-use value of all refrigerators that would have been discarded in the program’s absence (0.94). This approach acknowledged the next owner of the discarded appliances might use them as primary or secondary units.
Nine respondents indicated they did not install the CFLs. A variety of reasons were given for not installing the bulbs. One respondent said the bulb did not fit their fixture, and three said they intended to install them later, after present bulbs burned out.

**Tracking Database Review and Verification**

The program administrator tracked and provided Cadmus with two types of program data:

1. Data on recycled appliances (stored in a “Units” database).
2. Information about pickups (stored in an “Orders” database).

These integrated databases allowed the program administrator to record information collected via the call center or website, along with on-site data collected during pickups and post-pickup data recorded during recycling. The program administrator’s client web portal provided the Rocky Mountain Power program manager with real-time access to collected data and to other program results.

Cadmus reviewed the program administrator’s databases and compared participation recorded therein with participation reported in Rocky Mountain Power’s annual reports. Reported quantities matched the database, as shown in Table 17.

**Verification of Kit Recipients**

During the 2011–2012 evaluation, Cadmus discovered the program administrator’s database did not include records for reported energy-savings kits, and Cadmus had to rely on participant surveys to verify the receipt of kits. This resulted in a difference between the total number of kits reported and the number that participants recalled having been delivered.
Following identification of this issue, the Rocky Mountain Power program manager and the program administrator began tracking deliveries to each participant in 2013, and the tracking process improved.

For the 2013–2014 evaluation, Cadmus followed up on this issue during the program administrator interview by requesting kit delivery records and detailed descriptions of the tracking process.

JACO field technicians used personal digital assistant (PDA) devices to track appliance pickups and energy-savings kit deliveries. Customers signed the PDAs to confirm pick-up of their appliances and delivery of the kit. The field tech assigned each pick-up one of the following codes:

- Delivered Kit
- Left Behind Kit
- Manual Delivery Record Logged Kit Delivery (when PDA inoperable)
- Mailed Kit
- Customer Refused Kit
- Customer Ineligible for Kit
- Kits Unavailable, Customer Unavailable, Customer Service Representative (CSR) to follow up
- Kits Unavailable, Customer Requested Mailed Replacement
- Kits Unavailable, Customer Refuses Mailed Replacement

When kits were unavailable, the CSR attempted to contact the customer twice to offer a mail replacement. If the CSR could not contact the customer, the record was marked as a refusal, unless the customer contacted the call center to request a kit.

For the 2013–2014 program years, no customers refused their kits. Table 17 outlines reported and verified measure quantities.

**Net-to-Gross**

Cadmus used the following formula to estimate net savings for recycled refrigerators:

\[
\text{Net savings} = \text{Gross Savings} - \text{Freeridership and Secondary Market Impacts} - \text{Induced Replacement} + \text{Spillover}
\]
Where:

\[
\text{Evaluated Gross Savings} = \text{The evaluated in situ UEC for the recycled unit, adjusted for part-use;}
\]

\[
\text{Freeridership and Secondary Market Impacts} = \text{Program savings that would have occurred in the program’s absence;}
\]

\[
\text{Induced Replacement} = \text{Average additional energy consumed by replacement units purchased due to the program;}
\]

\[
\text{Spillover} = \text{Non-programmatic savings induced by the program.}
\]

Analysis of secondary market impacts required a decision-tree approach for calculating and presenting net program savings.

The decision tree—populated by the responses of surveyed participants—presented savings under all possible scenarios concerning participants’ actions regarding the recycled equipment. Through these scenarios, Cadmus used a weighted average of savings to calculate net savings attributable to the program. This chapter includes specific portions of the decision tree to highlight specific aspects of the net savings analysis. Appendix E (refrigerators) and Appendix F (freezers) present entire decision trees.

**Freeridership**

Cadmus’ freeridership analysis first asked participants if they had considered discarding the participating appliance prior to learning of the program. If participants did not previously consider appliance disposal, Cadmus categorized them as non-freeriders and excluded them from subsequent freeridership analysis.

Next, Cadmus asked all remaining participants (i.e., those who considered discarding their existing appliance before learning about SYLR) a series of questions to determine, in the program’s absence, the distribution of participating units likely to have been kept or discarded. Actions independent of program intervention followed three scenarios:

1. Unit was discarded and transferred to someone else.
2. Unit was discarded and destroyed.
3. Unit was kept in the home.

To determine the percentage of participants following each scenario, Cadmus asked surveyed participants about the likely fate of their recycled appliance, had it not been decommissioned through the SYLR Program. Cadmus categorized their responses as follows:

- Kept the appliance.
- Sold the appliance to a private party (i.e., via an acquaintance or through a posted advertisement).
- Sold or gave the appliance to a used appliance dealer.
- Gave the appliance to a private party, such as a friend or neighbor.
- Gave the appliance to a charity organization.
- Left the appliance on the curb with a “free” sign.
- Had the appliance removed by the dealer from whom the new or replacement appliance had been obtained.
- Hauled the appliance to a landfill or recycling center.
- Had the appliance picked up by a local waste management company.

Once Cadmus determined the final assessments of participants’ actions independent of SYLR, calculations could determine the percentage of refrigerators and freezers kept or discarded; Table 18 shows the results.

<table>
<thead>
<tr>

<td>70%</td>
<td>70%</td>
</tr>
<tr>
<td>Total</td>
<td></td>
<td>100%</td>
<td>100%</td>
</tr>
</tbody>
</table>

As shown in Table 18, 70% of respondents would not have kept their refrigerator. Of those, 64% would have discarded it by the following actions:

- Taking their appliance to the dump;
- Hiring someone to take the appliance to the dump; or
- Having a retailer pick up their appliance.

Having the retailer pick up the appliance did not necessarily indicate freeridership. This depended on the retailer’s decision whether or not to resell the unit. Not all appliances would be viable for resale. Cadmus used age as a proxy for secondary market viability and assumed any appliance over 10 years old would unlikely be resold by a retailer. Of respondents who indicated they would have had their appliance picked up by a retailer, all recycled an appliance over 10 years old. Together, these actions resulted in a 44% reduction in gross savings due to freeridership for refrigerators.15

Freeridership was greater for freezer recyclers. Of the 70% of respondents who would not have kept their freezer, 74% would have taken one of the three actions above that would have led to the appliance being removed from the grid. Thus, freeridership for freezers was 52%.

**Secondary Market Impacts**

If, in the program’s absence, a participant would have directly or indirectly (through a market actor) transferred the program-recycled unit to another Rocky Mountain Power customer, Cadmus estimated

---

15 70% of respondents not keeping their appliance multiplied by 64% of respondents who reported one of the three actions leading to freeridership equals 44% for refrigerators (including slight rounding). For freezers, 70% * 74% = 52%.
actions the would-be acquirer might have taken, given the unit would be unavailable without the program.

Some would-be acquirers in the market for a refrigerator or freezer might find another unit. Others might not (only taking the unit opportunistically). Difficulties arose in trying to quantify the change in the total number of refrigerators and freezers (overall and used) in use before and after program implementation and what effect the program would have on the total. Without such information, the UMP recommends that evaluators assume one-half of would-be acquirers would find an alternate unit. Without information to the contrary, Cadmus applied the UMP recommendation for this evaluation.

Cadmus then attempted to determine whether the alternate unit would likely be another used appliance (similar to those recycled through the program) or a new standard-efficiency unit (presuming that fewer used appliances would be available due to program activity).\(^{16}\)

Again, as discussed, definitively estimating this distribution proved difficult. The UMP recommends adopting a midpoint approach when primary research is unavailable: evaluators should assume one-half of the would-be acquirers who would have acquired an alternate unit would find a similar used appliance, and one-half would acquire a new, standard-efficiency unit.

Cadmus used the ENERGY STAR website\(^ {17}\) to determine energy consumption for new, standard-efficiency appliances. Cadmus averaged the reported energy consumption of new, standard-efficiency appliances with sizes and configurations comparable to the program units.

Figure 6 details Cadmus’ methodology for assessing the program’s impact on the secondary refrigerator market and for applying the recommended midpoint assumptions when primary data were unavailable (Appendix F provides a freezer-specific diagram). As evident, accounting for market effects resulted in three savings scenarios:

1. Full per-unit gross savings;
2. No savings; and
3. Partial savings (i.e., the difference between energy consumption of the program unit and the new, standard-efficiency appliance acquired alternatively).

---

\(^{16}\) A would-be acquirer also could select a new ENERGY STAR unit, but Cadmus assumed most customers in the market for a used appliance would upgrade to a unit at the next lowest price point (i.e., a baseline, standard-efficiency unit).

\(^{17}\) Energy consumption of a new, standard-efficiency appliance was calculated using the ENERGY STAR Website (http://www.energystar.gov/index.cfm?fuseaction=refrig.calculator), taking the average energy consumption of new, comparably sized, standard-efficiency appliances with similar configurations as the program units.
Integration of Freeridership and Secondary Market Impacts

After estimating the parameters of freeridership and secondary market impacts, Cadmus used the UMP decision tree to calculate average per-unit program savings, net of their combined effect. Figure 7 shows how Cadmus integrated these values into an estimate of savings net of freeridership and of secondary market impacts. The final savings net of freeridership and of secondary market impacts was calculated as the weighted average of savings for each decision tree category.

Induced Replacement

The UMP states that evaluators must account for the energy consumption of replacement units only when the program induced that replacement (i.e., when the participant would not have purchased the replacement refrigerator in the recycling program’s absence). For non-induced replacements, energy consumption of a replacement appliance is not germane to a savings analysis, as that appliance would have been purchased or acquired regardless of a program. Hence, acquisition of another appliance in conjunction with SYLR participation did not necessarily indicate induced replacement. Again, this method remained consistent with those outlined in the UMP.

Cadmus used participant survey results to determine which replacement refrigerators and freezers were acquired by SYLR participants due to the program. The results indicated SYLR reduced the total number
of used appliances operating within Rocky Mountain Power’s Idaho service territory and raised the average efficiency of active appliance stock. Across both appliance types, roughly 80% of participants replaced their recycled appliances. Additionally, of respondents replacing their appliances, 90% reported replacing their appliance with an ENERGY STAR-rated appliance.

Cadmus then used participant survey results to estimate the proportion of replacements induced by the customer’s participation in SYLR. Specifically, Cadmus asked each participant that replaced the participating appliance: “Were you planning to replace your appliance before you decided to recycle it through the See Ya Later, Refrigerator program?”

As it was unlikely a $30 incentive would provide sufficient motivation for most participants to purchase an otherwise unplanned replacement unit (costing from $500 to $2,000), Cadmus asked a follow-up question of participants who responded “No.” Intended to confirm the participant’s assertion that the program alone caused them to replace their appliance, the question asked: “Let me make sure I understand: you would not have replaced your appliance with a different appliance without the See Ya Later, Refrigerator program? Is that correct?”

To further increase the reliability of these self-reported actions, induced replacement analysis considered the following:

- Whether the refrigerator was a primary unit.
- The participant’s stated intentions in the program’s absence.

For example, if a participant would have discarded his/her primary refrigerator independent of the program, the replacement unit could not be induced (i.e., the participant very likely would not forego use of a primary refrigerator). For all other usage types and stated intention combinations, however, induced replacement offered a viable response, as shown in Figure 8.

**Figure 8. Induced Replacement—Refrigerators**

The final induced replacement rate was the product of the proportion of respondents who replaced their appliance and the proportion of those who were induced. As expected, only a portion of total replacements could be considered induced: the program induced 14% and 22% of refrigerator and freezer participants, respectively, to acquire a replacement unit.
The induced replacement rate was considerably higher than in the 2011–2012 evaluation\(^\text{18}\) and was slightly higher than other recent evaluations; the rate for freezers was considerably higher, as shown in Table 20. This could have resulted partly to the way the program was marketed. Marketing was targeted to zip codes where retailer market data suggested new appliances were being purchased. The idea was to target households that could have an extra appliance after making a new purchase. It was possible, however, that marketing targeted areas where customers were more likely to purchase a new appliance and the program marketing spurred their decision.

**Spillover**

Spillover refers to additional savings generated by program participants due to their program participation, but not captured by program records. Spillover occurs when participants choose to purchase energy-efficient measures or adopt energy-efficient practices due to influence of a program or marketing activities, but they do not apply for an incentive and, therefore, are not captured through any Rocky Mountain Power programs. In contrast with freeridership impacts, which reduce net program savings, spillover impacts increase net program savings.

Cadmus estimated spillover from program participants’ adopting additional measures as a result of their participation. A small effect revealed by a survey could translate into a large effect for the population as survey results would be applied to the population of eligible participants.

For the SYLR program, Cadmus measured spillover by asking the participants who completed the telephone survey if, due to the program, they installed another efficient measure or undertook other

---

\(^{18}\) Induced replacement rates were 7% and 7% for refrigerators and freezers, respectively, in the 2011–2012 evaluation.
energy efficiency activities. Respondents were asked to rate the relative influence of the SYLR program and incentive on their decisions to pursue additional savings.

Spillover questions sought to determine whether program participants installed any other energy-saving measures since participating in the program and to what extent the program influenced their decisions to purchase additional measures.

SYLR program participants were specifically asked whether they installed the following measures, which had recent, evaluated savings:

- High-efficiency dishwashers
- High-efficiency clothes washers
- High-efficiency refrigerators or freezers
- High-efficiency water heaters
- Any other high-efficiency measures

If the participant installed one or more of these measures, they were asked additional questions about in which year they purchased the measure, and whether they received an incentive for the measure. If applicable, participants were asked how influential the SYLR program was on their purchasing decisions (participants could answer not at all, not very, somewhat, or very influential).

Nine percent of participants (n=117) claimed to have installed energy-efficient measures or changed their behaviors after participating in the SYLR program. However, Cadmus did not quantify savings for all measures, only for energy-efficient refrigerators and freezers, clothes washers, ECM on gas furnaces, and televisions. This reduced the proportion of respondents with quantifiable savings to 3%.

Other measures, such as weatherization, water heaters, and HVAC, were difficult to quantify accurately based on survey data, and thus were not included in the spillover analysis. In addition, CFLs or LEDs, which were commonly mentioned, were not counted because of a high likelihood of double-counting savings claimed by the Home Energy Savings program through upstream CFL or LED sales.

Cadmus calculated participant spillover by estimating savings attributable to additional measures installed and to respondents stating that Rocky Mountain Power greatly influenced their decisions. Measures were counted if they were eligible for program incentives but those incentives had not been requested.

For calculating spillover savings, Cadmus used a top-down approach. The analysis began using a subset containing only survey respondents who indicated they installed additional energy-savings measures after participating in the SYLR program, but without receiving any incentives. From this subset, Cadmus removed participants who indicated the program was not very influential in their deciding to purchase additional measures.
For the remaining participants with spillover savings, Cadmus applied estimated energy savings from the 2011–2012 Home Energy Savings evaluation\(^{19}\) for additional measures installed. The savings values, calculated by Cadmus, were matched to additional measures installed by survey participants.

*Energy savings kits were assumed to have a 100% NTG as they were, free, unsolicited add-on measures.

---

\(^{19}\) The 2013–2014 Home Energy Savings evaluation was not completed by the time of this analysis; so Cadmus applied savings from the 2011–2012 evaluation.

\(^{20}\) The refrigerator sample size was 63, with gross per-unit savings of 1,136.3 for a total of 71,587 kWh. The freezer sample was 54, with gross per-unit savings of 869.08 kWh for a total of 46,930.
Summary of Impact Findings

Table 24, Table 25, and Table 26 summarize evaluated savings, using the UMP methodology for calculating for net savings, by program year and over the two-year evaluation period. Overall, the evaluated gross savings were close to reported gross savings, with the program achieving 1,273,559 of the reported 1,345,304 kWh savings, resulting in a 95% gross realization rate.

In both years, evaluated net savings were lower than reported savings. Overall, the program achieved less than one-half of reported savings, with a 39% net realization rate, as shown in Table 24.

*Precision for refrigerators and freezers exceeded 10% due to multiple estimated parameters outlined in the UMP, two separate gross savings parameters, and three net savings parameters, each with associated statistical error bounds. The sample was designed to achieve 90/10 confidence and precision for individual parameters. The combined error, however, after combining all parameters to determine final net per-unit savings, was unlikely to achieve 10% precision at the 90% confidence level. While these methods (which this report describes in detail) used higher variances than previous approaches, they produced more accurate, unbiased results.*

Process Evaluation

This section presents detailed staff interview findings and participant survey results. Focus areas include the following:

- Effectiveness of the delivery structure and implementation strategy
- Marketing approaches
- Customer satisfaction
- Internal and external communications

Methodology

Cadmus conducted the following process evaluation research:

- Document review, including:
  - Past evaluations
  - Logic models
  - The program website
- Utility staff and administrator interviews
- Participant surveys

Cadmus developed stakeholder interview guides and performed interviews with program management staff to collect information about key topics. Stakeholder interviews included program managers at Rocky Mountain Power and JACO. Discussed interview issues included the following:

- Process flow
- Program design and implementation
- Changes in implementation and program marketing
- Strengths and areas for improvement

Cadmus conducted interviews by phone, using e-mail to follow up with interviewees concerning questions and clarifications.

The evaluation also included telephone surveys, conducted with participating customers. Cadmus designed survey instruments to collect data on the following topics:

- **Customer information.** Demographic information and household statistics.
- **Program process.** Details to inform the following performance indicators:
  - What were the participation motivations and barriers?
  - Were program incentives set correctly?
  - Was the program process effective?
• How satisfied were customers with the program?
• What were the program’s strengths and areas for improvements?

Program Implementation and Delivery
Drawing on stakeholder interviews and participant survey response data, this section discusses the SYLR program implementation and delivery.

Program History and Program Management
According to the program administrator, Rocky Mountain Power and the program administrator established 2013–2014 program goals based on prior program performance and harvest rates, along with remaining potential identified through Rocky Mountain Power’s conservation potentials assessment.

In 2013, Rocky Mountain Power issued a new request for proposals, designing the contract so the program administrator would incur a financial penalty if the SYLR program did not meet its participation goals. Additionally, 2013 participation goals aligned more closely with recent program performance. Rocky Mountain Power received a monthly invoice and report from the program administrator; this included the number of pick-ups, kits delivered, a two-hour appointment metric, call center response times, reasons for rejecting units, and time required for mailing incentive checks.

In 2011, Rocky Mountain Power staff reported that they had found some inconsistencies between monthly reports and invoices; so, in 2012, they began comparing monthly reports, invoices, and the dashboard to ensure consistency. Improved monitoring appeared to resolve inconsistencies, and this evaluation verified that reported unit counts remained consistent with the program administrator’s databases.

On July 1, 2014, program qualifications were expanded to include nonresidential customers with qualifying units and pickups by participating retailers to recycle. In 2014, however, no businesses or retailers participated.

Program Staffing and Training
In 2013–2014, JACO Environmental implemented the SYLR Program for Rocky Mountain Power, serving as the implementer since the program’s inception. Program staff included a Rocky Mountain Power program manager, Portland Energy Conservation, Inc. (PECI) as a marketing contractor, and Appliance Distribution, Inc., as a subcontractor to JACO.

---

21 The harvest rate was the number of units recycled through the program in a given year, divided by the total number of residential customer accounts in the service territory.

22 PECI merged with CLEAResult on October 10, 2014.
Both Rocky Mountain Power and JACO Environmental reported adequate staffing levels and effective working relationships among parties involved in program implementation.

**Delivery Structure and Processes**

Rocky Mountain Power and the program administrator reported designing a program similar to ARPs operating in other states. Program development followed four main delivery steps:

1. Marketing
2. Sign-Up/Scheduling
3. Appliance Pick-Up
4. Incentive Payment

Although the program did not include minimum equipment age requirements for qualifying appliances, PECI’s marketing tailored messages to appeal to owners of older and secondary refrigerators.

Rocky Mountain Power’s Idaho customers who were interested in disposing of an eligible appliance could obtain information or sign up to participate through Rocky Mountain Power’s website or by calling the program administrator toll-free. During 2014, 29% (n=547) of customers enrolled online, an increase from 19% (n=540) enrolling online in 2013. When participants signed up, the program administrator collected details about how customers learned of the program, verified eligibility, and scheduled pick-up times. The customer received a two-hour time window for appliance pick-up on a specific day, and was required to have the appliance plugged in and running upon pickup.

Wait times for Idaho participants remained consistent. The time between scheduling and pick-up averaged 17 days in 2013 and 18 days in 2014, consistent with average wait times of 17 days over the 2011–2012 evaluation period. The program administrator noted that pick-up wait times tended to be shortest in urban areas, while customers in outlying areas experienced longer waits.

At the scheduled time, the contractor picked up and verified that the appliance was in working condition, and collected data about the appliance age, size, configuration, and features. Since 2011, the pick-up crew used hand-held computer devices to perform a variety of quality assurance and quality control (QA/QC) functions and to enable the pick-up process. The contractor photographed the unit and recorded its model number and unit number. Customers signed the hand-held device upon completion of the pick-up. During the appliance pick-up, the contractor provided participants with an energy-saving kit.

The kits were purchased and distributed by JACO, with their contents based on specifications provided by Rocky Mountain Power. Since 2013, kit delivery was tracked for each customer. On the hand-held device, participants indicated whether or not they received a kit at the time of their pick-up. For customers participating in the program through a retailer (e.g., Sears), JACO shipped the kits by mail following the pick-up rather than delivering them at the time of the pick-up.
The program administrator brought appliances to Appliance Distribution’s facility in Salt Lake City for decommissioning and recycling. The program administrator then mailed incentive checks to participants.

**Forms and Incentives**
The SYLR Program required minimal paperwork for participating customers. The sign-up process, which could be completed by phone or online, did not require customers to fill out lengthy forms. Customers who signed up by phone provided information, including their address and the unit’s location, and answered a few screening questions. Customers who signed up online responded to these questions through a brief, one-page online form.

Customers expressed high satisfaction levels with the program:

- 100% (n=115) of surveyed participants reported they were very or somewhat satisfied with their experience overall.
- 99% (n=114) were very or somewhat satisfied with JACO’s appliance pick-up.

**Marketing**
Beginning in 2012, the program administrator selected PECI (the program administrator for the Home Energy Savings program) as the marketing subcontractor. During 2013 and 2014, PECI provided marketing collateral for the program and launched an outreach campaign to increase retailer involvement. This relationship ended at the close of 2014.

**Approach**
Program marketing slightly changed its focus during 2013 and 2014; PECI sought to contact retailers in Rocky Mountain Power’s territory, urging them to help promote the program, including training sessions with the retailers. PECI had preexisting relationships with these retailers due to its administration of Rocky Mountain Power’s Home Energy Savings program, which provides customers with rebates for installing energy-efficient equipment, including refrigerators and freezers. All previously utilized advertising marketing channels continued, though advertising channel budgets decreased somewhat from 2011–2012 levels to fund retailer outreach activities.

Participants learned of the program through a variety of methods, with bill inserts and word-of-mouth the most common, as shown in .

Figure 9.
In a separate question, 60% of participants cited bill inserts as the best way for Rocky Mountain Power to communicate about energy efficiency opportunities, while e-mail was cited by 15% and television by 10% of respondents as the best method for informing customers. The largest gap between actual awareness sources and preferred sources was email, preferred by 15% but the source of program awareness for only 4% of SYLR participants. The most significant changes in awareness sources since the 2011–2012 evaluation were greater mentions of Rocky Mountain Power’s website (up from 3%, n=198) and fewer mentions of bill inserts (down from 54%, n=198).²³

According to the program manager and program administrator staff, JACO closely examined past pick-up trends to inform and develop marketing plans. Observations about the program’s seasonality—with participation rising in the spring and summer and peaking in the fall—led program administrator staff to recommend aligning advertising and bill inserts with this seasonal behavior. Consequently, during 2013 and 2014, advertising expenditures were highest in April–May and August–September.

**Targeting**

Program and administrator staff reported that they did not target customers for the SYLR program based on demographic or market characteristics, rather they targeted customers who could have a second refrigerator or freezer. During the evaluation period, PECI sent mailings to customers who participated in the Home Energy Saving program and received a rebate for a new appliance. These customers could have extra units eligible for recycling. PECI also targeted its research toward zip codes where retailer market data indicated the most new units were purchased.

---

²³ Both of these differences were significant at p<.05 using binomial t-test.
Compared to customers in the general population, SYLR program participants were more likely to be homeowners of single-family residences. The 2013–2014 demographic results were consistent with previous evaluations. Table 27 shows average demographics for surveyed participants.

Table 27. Participant Demographics

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>

<td>97%</td>
</tr>
<tr>
<td>Average Household Size (number of people)</td>
<td>3.1</td>
<td>2.9</td>
<td>3.1</td>
</tr>
</tbody>
</table>

The majority of 2013 and 2014 participants (88%) lived in single-family, detached residences, while 12% lived in a multifamily, attached, mobile, or manufactured home. This represented a significant\(^\text{24}\) increase in participation for non-single-family, detached households—up from 5% in the 2011–2012 survey. Given self-reported participant contact information (i.e., landlines or cell phones), the survey was less likely to experience bias for respondents with landlines, as often produced by random-digit-dial surveys.

**Customer Response**

**Satisfaction**

As shown in Figure 10, participants experienced high overall satisfaction rates with the program: 87% of participants reported being very satisfied with the program, and none reported dissatisfaction. Utility ARP programs commonly report such high customer satisfaction levels due to the nature of participation: the customer pays no out-of-pocket costs, and customers very rarely indicate regret having disposed of their old appliances.

\(^\text{24}\) Significant at p<.05 using binomial t-test.
Participants also reported high satisfaction levels with JACO contractors, who picked up the units for recycling, with 87% saying they were “very satisfied” and only 1% reporting dissatisfaction, as shown in Figure 11.

Program and administrator staff noted that the SYLR Program rarely received customer complaints. Pick-up staff’s use of hand-held computers allowed them to communicate quickly with JACO’s call center, enabling all involved parties to communicate efficiently and knowledgeably with the customer if problems arose (e.g., locating their home, picking up the unit).
Nearly all participants (98%, n=55) who recalled receiving the program-provided energy efficiency kit found the information included helpful, as shown in Figure 12. One-third of customers who recalled the informational booklet included with the kit reported they followed advice the booklet provided (33%, n=46). Actions taken by participants included the following:

- Adjusting thermostats and temperature settings on water heaters, refrigerators, and freezers;
- Adding insulation and sealing leaks;
- Upgrading to efficient lighting (CFLs and LEDs);
- Running washers and dryers during off-peak hours; and
- Turning off and unplugging electronic items when not in use.

**Influence on Participation in Other Programs and Actions**

The survey asked participants if they had participated in another Rocky Mountain Power energy efficiency incentive program since participating in SYLR, and how influential their participation in SYLR was in their decision to participate in other programs. Ten percent (n=115) of SYLR participants said they already had participated in another Rocky Mountain Power program.

**Error! Not a valid bookmark self-reference.** shows that 67% (n=12) of participants who participated in another program said their participation in SYLR was “very influential” or “somewhat influential” on their decision to participate in another Rocky Mountain Power program, and only 25% said their participation in SYLR was “not influential at all.” Participants who participated in other Rocky Mountain Power energy efficiency programs reported that they pursued the following:
- CFLs
- Water-saving measures (aerators and showerheads)
- Weatherization and insulation
- Rebates for efficient water heaters and washing machines
- Recycling more appliances

**Figure 13. Influence of SYLR Program on Participation in Other Rocky Mountain Power Programs**

The survey also asked participants how likely they would be to participate in other energy efficiency programs, based on their experience participating in the SYLR program. A majority (64%, n=114) said they would be much more likely to participate in other programs, while only 4% said they would be less likely to participate; another 4% said they would be neither more nor less likely to participate in other programs. Figure 14 shows the results.
The survey asked participants if they had taken additional energy-saving actions outside of participating in Rocky Mountain Power programs, and how influential their participation in SYLR was in taking these additional actions. Nearly one-half of surveyed customers reported taking additional energy-saving actions, aside from participating in utility-sponsored incentive programs (43%, n=115). Of participants taking additional actions, only 10% (n=48) stated they received Rocky Mountain Power incentive rebates for items they purchased. The most common actions taken by participants (who reported taking action outside of incentive programs) were lighting upgrades (29%, n=48), as shown in Figure 15.
A majority of surveyed participants (63%, n=49) cited their participation in SYLR as “very” or “somewhat influential” on their decisions to take additional actions, as shown in Figure 16.

**Figure 16. Influence of SYLR Program on Additional Actions**

![Bar chart showing the influence of SYLR program on additional actions.]

Combines responses from the previous questions about energy efficiency actions taken through utility programs or on the customer’s own initiative; it shows more than one-quarter of SYLR participants (28%, n=117) had already participated in other energy efficiency programs or had taken independent actions influenced by the SYLR Program. Another 60% of participants had not taken additional actions influenced by the SYLR Program or participated in other energy efficiency programs, but reported they were more likely to participate in energy efficiency programs due to their experience in the program. The remaining 12% of participants had neither taken actions influenced by the program nor were likely to participate in other energy efficiency programs.

Figure 17 combines responses from the previous questions about energy efficiency actions taken through utility programs or on the customer’s own initiative; it shows more than one-quarter of SYLR participants (28%, n=117) had already participated in other energy efficiency programs or had taken independent actions influenced by the SYLR Program. Another 60% of participants had not taken additional actions influenced by the SYLR Program or participated in other energy efficiency programs, but reported they were more likely to participate in energy efficiency programs due to their experience in the program. The remaining 12% of participants had neither taken actions influenced by the program nor were likely to participate in other energy efficiency programs.
Incentive Payments

Only 7% of participants reported waiting longer than six weeks to receive their incentive payments, while 45% received their payments within four weeks. The remainder received payments within four to six weeks. Participants were asked if they recommended the SYLR Program to their friends, relatives, or colleagues; 69% (n=117) reported that they recommended the program.

When asked if they would have participated in the SYLR program if it did not offer a monetary incentive, a majority (65%, n=111) indicated they would.

Cadmus has evaluated several other programs, however, where incentive levels varied and found participation responds to changes in incentives. In a recent evaluation for California, Cadmus noted that, after Southern California Edison decreased its per-unit incentive for refrigerators from $50 to $35, participation dropped by 17%. Additionally, participation was 27% lower, on average, at $35 (compared to $50 per unit).25

Participants were asked “How likely would you be to participate if you could give your incentive to charity?” Twenty-four percent of participants indicated they would not likely participate in the program under those conditions, while 31% said they would still be “very likely” to participate, and 45% said they would be “somewhat likely”; Figure 18 presented the details.

Barriers
Overall, participants did not report notable complaints or issues during the surveys, and, based on the overall process evaluation, Cadmus did not identify significant participation barriers. The program functioned smoothly, likely due to its longevity in the Idaho market and due to the program administrator’s experience.

Quality Assurance/Quality Control
The SYLR Program used multiple QA/QC checkpoints to facilitate quality delivery and accurate data tracking. During the recent evaluation period, handheld devices were used to record pick-ups.

When a pick-up crew arrived at a customer’s home, they verified the unit was in working condition and fit the size criteria. If the unit passed those two tests (therefore meeting the program criteria), the crew entered the model number, unit number, size, and age into the handheld device, and took a picture of the unit from a specific angle. If the unit did not meet the program’s criteria, the crew still took a picture and recorded why the unit was not accepted. The pick-up crew also indicated if they caused any damage during their visit. Information uploaded to the handheld device reached the program administrator’s database within five minutes, becoming available to all authorized program users.

When the unit arrived at the warehouse, warehouse staff scanned the unit, and the appliance picture taken by the pick-up staff appeared, serving as verification that the correct unit had arrived at the warehouse and would be processed for recycling.

In addition to the QA/QC performed by the program administrator, an independent contractor hired by Rocky Mountain Power performed follow-up inspections for a 5% random sample of participant homes.
These inspections ensured that pick-up procedures were followed and any issues were reported to Rocky Mountain Power and the program administrator.
**Cost-Effectiveness**

In assessing cost-effectiveness, Cadmus analyzed program costs and benefits from five different perspectives, using Cadmus’ DSM Portfolio Pro\(^\text{26}\) model. The California Standard Practice Manual for assessing DSM program cost-effectiveness describes the benefit/cost ratios Cadmus used in employing the following five tests:

1. **PacifiCorp Total Resource Cost (PTRC) Test**: This test examined program benefits and costs from Rocky Mountain Power’s and Rocky Mountain Power customers’ perspectives, combined. On the benefit side, it included avoided energy costs, capacity costs, and line losses, plus a 10% adder to reflect non-quantified benefits. On the cost side, it included costs incurred by the utility and participants.

2. **Total Resource Cost (TRC) Test**: This test also examined program benefits and costs from Rocky Mountain Power and Rocky Mountain Power customers’ perspectives, combined. On the benefit side, it included avoided energy costs, capacity costs, and line losses. On the cost side, it included costs incurred by the utility and participants.

3. **Utility Cost Test (UCT)**: This test examined program benefits and costs solely from Rocky Mountain Power’s perspective. The benefits included avoided energy, capacity costs, and line losses. The costs included program administration, implementation, and incentive costs associated with program funding.

4. **Ratepayer Impact Measure (RIM) Test**: All ratepayers (participants and nonparticipants) may experience rate increases designed to recover lost revenues. The benefits included avoided energy costs, capacity costs, and line losses. This test included all Rocky Mountain Power program costs and lost revenues.

5. **Participant Cost Test (PCT)**: From this perspective, program benefits included bill reductions and incentives received. Costs included a measure’s incremental cost (compared to the baseline measures), plus installation costs incurred by the customer.

Table 28 summarizes the five tests’ components.

\(^{26}\) DSM Portfolio Pro has been independently reviewed by various utilities, their consultants, and a number of regulatory bodies, including the Iowa Utility Board, the Public Service Commission of New York, the Colorado Public Utilities Commission, and the Nevada Public Utilities Commission.

</tr>
</tbody>
</table>

*Includes avoided line losses.

**Incentive costs typically are excluded from the TRC as transfer payments. For ARPs such as SYLR, however, participants did not incur costs. Therefore, the incentive cost was treated differently from incentives in typical DSM programs. Rather than excluding it from the TRC, it was treated as an administrative cost, as it did not offset participant costs. Consequently, for SYLR, the UCT and the TRC costs are equal.

Table 29 provides cost analysis inputs, including evaluated energy savings for each year and discount rates, line losses, and program costs. Rocky Mountain Power provided all of these values, except evaluated energy savings and evaluated participation. Cadmus derived the discount and inflation rates from Rocky Mountain Power’s 2013 Integrated Resource Plan. Measure lives used (shown in Table 29) were derived from annual report data provided by Rocky Mountain Power and were based on Cadmus’ recommendations from the 2011–2012 SYLR program evaluation. Maintaining consistency with annual reports allowed more direct comparisons of reported and evaluated results. For all analyses, Cadmus used avoided costs associated with PacifiCorp’s 2013 IRP East Residential Whole House 35% and Residential Lighting 48% Load Factor Decrement.27

### Cost-Effectiveness Results

Table 30 presents the program cost-effectiveness analysis results, including the evaluated NTG\(^{28}\) for all program measures during the evaluation period (2013–2014), but not accounting for non-energy benefits (except those represented by the 10% conservation adder included in the PTRC test). A benefit/cost ratio greater than 1.0 is considered cost-effective. Cost-effectiveness analysis results indicate the combined 2013–2014 program proved cost-effective for all perspectives, except the RIM test. The PCT benefit/cost ratio could not be calculated because no costs were associated with this test perspective, only benefits.

For the 2013–2014 evaluation period, SYLR had an overall TRC benefit-cost ratio of 1.14, lower than the 1.57 found in the 2011–2012 program cycle. The 2011–2012 program achieved evaluated NTG of 53.9% for refrigerators and 47.6% for freezers, compared to 41.5% and 28.3%, respectively, for the 2013–2014 program. The 2011–2012 program achieved net savings of over 779,150 kWh, compared to 526,371 for 2013–2014, while 2011–2012 program costs were only about 3% more than in 2013–2014.

Appendix B. Precision Calculations

To determine the savings results’ uncertainty level, Cadmus considered the sampling error’s effect on all estimates presented in the report. Sampling error refers to uncertainty introduced by use of sampled data to infer characteristics of the overall population. These data include survey results, meter data, and data from secondary sources. Cadmus used sampled data to estimate the parameters of per-unit savings calculations (e.g., installation rates) and to estimate the consumption of specific equipment types (e.g., billing analysis).

Sampling error has been reflected in estimated confidence intervals. Unless otherwise noted, Cadmus estimated intervals at 90% confidence, indicating a 90% confidence that the true population value fell within the given interval. Cadmus calculated confidence intervals for means, proportions, regression estimates, and any calculated values using sample estimates as an input. Cadmus calculated all confidence intervals using the following standard formula for estimating uncertainty for proportions and means:

\[
Confidence \ Interval_{mean} = mean \pm 1.645 \times \sqrt{\frac{s^2}{n}}
\]

Where:
- 1.645 = the z-score for a 90% confidence interval.
- \(s^2\) = the sample variance.

In some cases, the uncertainty of estimates derived from multiple sources. For example, for summed estimates (such as those for total program savings), Cadmus calculated the root of the sum of the squared standard errors to estimate the confidence interval:\(^2\)

\[
Confidence \ Interval_{X+Y} = (X + Y) \pm 1.645 \times \sqrt{(\frac{s^2_X}{n_X}) + (\frac{s^2_Y}{n_Y})}
\]

In other cases, Cadmus multiplied estimates. For instance, net savings calculations involved combining gross estimates with an in-service rate and/or NTG ratio estimated from participant surveys. For these results, Cadmus calculated combined standard errors for the final estimates. Where the relationship was multiplicative, Cadmus used the following formula:\(^3\)

---

Confidence Interval $\bar{x} \cdot \bar{y} = \bar{x} \cdot \bar{y} \pm 1.645 * \sqrt{\bar{y}^2 \left( \frac{s^2_x}{n_x} \right) + \bar{x}^2 \left( \frac{s^2_y}{n_y} \right) + \frac{s^2_x}{n_x} \left( \frac{s^2_y}{n_y} \right)}$

To ensure transparency of the error aggregation process, Cadmus reported precision for individual and combined estimates (where relevant).
Appendix C: Participant Survey Instrument

A. **Introduction**

These questions ensure we are speaking to the person in the household who is the most knowledgeable about the program and the household’s participation in the program.

A1. Hello, I’m [INSERT NAME] calling from VuPoint Research on behalf of [UTILITY]. We are not selling anything. May I speak with [CONTACT NAME]? OR [IF NO NAME] May I speak with the person who is most familiar with the [UTILITY] See Ya Later, Refrigerator program? [IF THAT PERSON IS NOT AT THIS PHONE NUMBER, ASK FOR NAME AND PHONE NUMBER AND START AGAIN] [IF NEEDED: THE SEE YA LATER, REFRIGERATOR PROGRAM PROVIDES AN INCENTIVE FOR [UTILITY] CUSTOMERS ALONG WITH FREE PICK UP AND RECYCLING FOR WORKING REFRIGERATORS, FREEZERS, AND ROOM AIR CONDITIONERS]

1. (Yes)

98. (DON’T KNOW) [ASK TO SPEAK WITH SOMEONE WHO KNOWS AND BEGIN AGAIN]

99. (REFUSED) [THANK AND TERMINATE]

A2. We are not selling anything. [UTILITY] Utilities is actively seeking your opinions about energy efficiency programs that could help customers save money on their electric bills. We are conducting an important study about [UTILITY]’s See Ya Later, Refrigerator program. Are you the best person to speak with? This call may be monitored or recorded for quality assurances purposes. [IF NEEDED: Your responses will be used as part of a study to improve [UTILITY] energy efficiency programs.] [IF NEEDED: The See Ya Later, Refrigerator program provides an incentive for [UTILITY] customers along with free pick up and recycling for working refrigerators, freezers, and room air conditioners.]

1. (Continue)

The next two questions determine whether the respondent can safely participate in the survey at this time.

A3. *Are you currently talking to me on a regular landline phone or a cell phone?*

1. Regular landline phone

2. Cell Phone

98. (DON’T KNOW)

99. (REFUSED)

[ASK IF A3 = 2]

A4. *Are you currently in a place where you can talk safely and answer my questions?*

1. (Yes)

2. (No) [Schedule call back]

3. (No) (DO NOT CALL BACK. THANK AND TERMINATE)

98. (DON’T KNOW) [SCHEDULE CALL BACK]
99. (REFUSED) [SCHEDULE CALL BACK]

A5. Our records show that on [DATE] you had at least one [MEASURE1] removed by [UTILITY]’s See Ya Later, Refrigerator program. Is this correct? [INTERVIEWER NOTE: Please verify appliances are correct before selecting “yes.”]
   1. (Yes, both date and appliance are correct)
   2. (Appliance is correct, date unknown)
   3. (No, appliance incorrect) [THANK AND TERMINATE]
   4. (No, didn’t participate; didn’t remove refrigerator or freezer) [THANK AND TERMINATE]

98. (DON’T KNOW) [ASK FOR THE PERSON WHO WOULD BE MOST FAMILIAR AND BEGIN AGAIN.]
99. (REFUSED) [THANK AND TERMINATE]

[THANK AND TERMINATE TEXT]
For this survey we are only including households that have recycled a [MEASURE]. We do appreciate you taking our call. Thank you and have a good [evening/day.]

If didn’t recycle anything

[THANK AND TERMINATE TEXT]
For this survey we are only including households that have recycled a refrigerator or freezer in 2014. We do appreciate you taking our call. Thank you and have a good [evening/day.]

A6. *Have you ever been employed in the market research field?
   1. Yes [THANK AND TERMINATE]
   2. No [CONTINUE]
   99. REFUSED [THANK AND TERMINATE]

A7. *Have you or anyone in your household, ever been employed by or affiliated with [UTILITY] Corporation, or any other utility?
   1. Yes [THANK AND TERMINATE]
   2. No [CONTINUE]
   99. REFUSED [THANK AND TERMINATE]

[THANK AND TERMINATE TEXT]
For this survey we are only including households that have not been employed in the market research field or with [UTILITY]. We do appreciate you taking our call. Thank you and have a good [evening/day.]

Back-up information, not to be programmed:

[If “No – Not a convenient time,” ask if Respondent would like to arrange a more convenient time for us to call them back or if you can leave a message for that person.]

[IF RESPONDENT ASKS HOW LONG, SAY: “APPROXIMATELY 10 MINUTES.”]
B. Quantity Verification

These questions are designed to verify that the quantities in the database are correct.

[IF [REF_QTY] >=1]

B7. Our program records indicate you received an incentive for recycling [REF_QTY] refrigerator(s), in [UTILITY]’s program in 2014. Is this correct?
   1. (Yes, that is correct)
   2. (No, quantity not correct)
   98. (DON'T KNOW)
   99. (REFUSED)

[ASK IF B1 =2]

B8. How many refrigerators did you have recycled through [UTILITY]’s program in 2014?
   1. [RECORD QUANTITY] [CREATE VARIABLE [VREF_FL]]
   98. (DON'T KNOW)
   99. (REFUSED)

[IF [FRZ_QTY] >=1]

B9. Our program records indicate you received an incentive for recycling [FRZ_QTY] freezer(s), in [UTILITY]’s program in 2014. Is this correct?
   1. (Yes, that is correct)
   2. (No, quantity not correct)
   98. (DON'T KNOW)
   99. (REFUSED)

[ASK IF B3 = 2]

B10. How many freezers did you have recycled through [UTILITY]’s program in 2014?
    1. [RECORD QUANTITY] [CREATE VARIABLE [VFRZ_FL]]
    98. (DON'T KNOW)
    99. (REFUSED)
C. Program Awareness

This section is for program participants. Questions in this section assess marketing channels along with whether the respondent would recommend the program.

C7. How did you learn about the See Ya Later, Refrigerator program? Was it from [UTILITY], from a contractor or retailer, from a friend or family member or some other way? [ASK THE APPROPRIATE FOLLOW-UP QUESTION TO GET MORE DETAIL ABOUT HOW THEY LEARNED ABOUT THE PROGRAM] [MULTIPLE RESPONSES; ALLOW UP TO 3; DO NOT READ LIST]

[UTILITY]: Was it from a bill insert, the newsletter, an email, social media, [UTILITY] website, [UTILITY] advertisement, or a [UTILITY] employee? [CODE BELOW]

[Utility]
1. Newspaper/Magazine/Print Media ([UTILITY] mailer)
2. Bill Inserts
3. Rocky Mountain Power/Pacific Power website
4. Rocky Mountain Power/Pacific Power Representative
5. E-mail from Rocky Mountain Power/Pacific Power

[Media]
6. Internet Advertising/Online ad
7. Radio
8. TV
9. Billboard/outdoor ad
10. Other website

[Contractor]
11. Appliance Recycling Contractor

[Friend or Family]
12. Family/friends/word-of-mouth
13. [Shows/event]Retailer/Store
14. Sporting event
15. Home Shows/Trade Shows
16. Other [RECORD VERBATUM]

98. (DON’T KNOW) [SKIP TO NEXT SECTION (D1)]
99. (REFUSED) [SKIP TO NEXT SECTION (D1)]

[ASK C1 = 1 THROUGH 15]

C8. What are the best ways for [INSERT UTILITY] to inform you about energy-efficiency offerings like the appliance recycling program? [DO NOT READ. PROMPT IF NECESSARY. RECORD UP TO THREE RESPONSES]

[Utility]
1. Newspaper/Magazine/Print Media ([UTILITY] mailer)
2. Bill Inserts
3. Rocky Mountain Power/Pacific Power website
4. Rocky Mountain Power/Pacific Power Representative
5. E-mail from Rocky Mountain Power/Pacific Power

[Media]
6. Internet Advertising/Online Ad
7. Radio
8. TV
9. Billboard/outdoor ad
10. Other website

[Contractor]
11. Appliance Recycling Contractor

[Friend or Family]
12. Family/friends/word-of-mouth
13. [Shows/event]Retailer/Store
14. Sporting event
15. Home Shows/Trade Shows
16. Other [RECORD VERBATUM]

98. (DON'T KNOW)
99. (REFUSED)

C9. How would you rate your current understanding of energy-efficiency? Would you say you... [READ LIST. RECORD FIRST RESPONSE]

1. Have a very good understanding
2. Have a good understanding
3. Have a limited understanding
4. Have very little understanding of energy-efficiency

98. (DON'T KNOW)
99. (REFUSED)

D. Refrigerator/Freezer Part-use

This section determines the portion of the year the appliance was in use, whether it was a primary or secondary appliance, and whether the appliance was kept in a location that was subject to weather extremes.

[IF VREF_FL>1 FROM B1 or B2 AND MEASURE1 = REF OR VFRZ_FL>1 FROM B3 or B4 AND MEASURE1 = FRZ THEN]
[Ask only if the respondent recycled more than one of the same type of unit]

Now I am going to ask you some questions about the [CONFIGURATION] [MEASURE1] that you recycled, please answer all subsequent questions with this specific appliance in mind.
D7. Approximately how old was your [MEASURE1]? [INTERVIEWER: RECORD IN YEARS. ENTER “00” IF LESS THAN ONE YEAR OLD.]
   1. [RECORD YEARS]
   98. (DON’T KNOW)
   99. (REFUSED)

D8. How would you describe the condition of the [MEASURE1] you recycled through the program? Would you say ...? [READ LIST AND RECORD ONE RESPONSE. PROVIDE EXAMPLES IF NECESSARY]
   1. It worked well and was in good physical condition.
   2. It worked okay but had some problems [Example: it wouldn’t defrost].
   3. It didn’t work (Example: turned on but did not cool or did not turn on)
   98. (DON’T KNOW)
   99. (REFUSED)

D9. In the last year, how much was the [MEASURE1] used? Was it...(READ LIST)?
   1. Kept running all the time
   2. Plugged in only for special occasions or certain months of the year
   3. Never plugged in or running
   4. (Other) [SPECIFY]
   98. (DON’T KNOW)
   99. (REFUSED)

[ASK IF D3 = 2]

D10. During the last year, how many total months do you think it was plugged in and running? (USE “99’ FOR DON’T KNOW AND “98” FOR REFUSED.)
   1. [RECORD MONTHS] [RANGE 1-12;]
   98. (DON’T KNOW)
   99. (REFUSED)

D11. For the majority of the last year, where within your home was the [MEASURE1] located? [RECORD ONE RESPONSE; READ LIST IF NEEDED]
   1. Kitchen
   2. Garage
   3. Porch/patio
   4. Basement
   5. (Other) [SPECIFY]
   98. (DON’T KNOW)
   99. (REFUSED)

D12. Was the location heated?
   1. Yes
   2. No
   98. (DON’T KNOW)
   99. (REFUSED)
D13. Was the location cooled?
   1. Yes
   2. No
   98. (DON’T KNOW)
   99. (REFUSED)

E. Replacement

This section verifies whether appliances were replaced after the prior units were recycled through the program. This section also determines whether replacements were naturally occurring or whether they were induced by the program and need to be accounted for in net savings.

E7. Did you replace the [MEASURE1] you recycled?
   1. Yes
   2. No [SKIP TO F1]
   99. (DON’T KNOW) [SKIP TO F1]
   98. (REFUSED) [SKIP TO F1]

[ASK IF E1 = 1]

E8. How did you acquire the replacement appliance? Did you... [READ LIST]
   1. Buy it
   2. Get it for no charge
   99. (DON’T KNOW)
   98. (REFUSED)

[ASK IF E1 = 1]

E9. Why did you decide to replace your [MEASURE1]? [READ LIST; SELECT ONE RESPONSE]
   1. Wanted to upgrade (example: more space, new features)
   2. Old appliance was not working well
   3. Was planning to give previous [MEASURE1] away
   4. (Other) [SPECIFY]
   98. (DON’T KNOW)
   99. (REFUSED)

[ASK IF E1 = 1]

E10. Was the replacement [MEASURE1] new or used?
   1. New
   2. Used
   98. (DON’T KNOW)
   99. (REFUSED)
[ASK IF E1 = 1]

E11. Was the replacement [MEASURE1] an ENERGY STAR or high-efficiency model?
   1. Yes - ENERGY STAR or High efficiency
   2. No - Standard efficiency
   99. (DON’T KNOW)
   98. (REFUSED)

[ASK IF E5 = 1]

E12. How influential was your participation in the program in your decision to purchase an ENERGY STAR model?
   1. Very influential
   2. Somewhat influential
   3. Not too influential
   4. Not influential at all
   98. (DON’T KNOW)
   99. (Refused)

[ASK IF E1 = 1]

E13. Were you planning to replace your [MEASURE1] before you decided to recycle it through [UTILITY]’s See Ya Later, Refrigerator program?
   1. Yes
   2. No
   99. DON’T KNOW
   99. REFUSED

[ASK IF E1 = 1 AND E7= 2]

E14. Let me make sure I understand: you would not have replaced your [MEASURE1] with a different [MEASURE1] without the See Ya Later, Refrigerator program? Is that correct?
   1. Yes, correct
   2. No, not correct
   98. (DON’T KNOW)
   99. (REFUSED)

F. Freeridership

This section determines the likely fate of appliances outside of the program which informs freeridership and which appliances are subject to secondary market impacts.

[ASK IF E1 = 2]

F7. Did you consider getting rid of the [MEASURE1] before you heard about [UTILITY]’s See Ya Later, Refrigerator program?
[If necessary: By getting rid of, I mean getting the appliance out of your home by any means including selling it, giving it away, having someone pick it up, or taking it to the dump or a recycling center yourself.]

1. Yes  
2. No  
98. (DON’T KNOW)  
99. (REFUSED)

F8. If the program was not available, would you have kept your [MEASURE1]?  
1. Yes  
2. No  
98. (DON’T KNOW)  
99. (REFUSED)

[ASK IF D5 = 1 and F2=1 and MEASURE1 = Refrigerator]

F9. If you had kept the [MEASURE1], would you have kept it in the same location you mentioned earlier? That is would it have been located in the [READ IN ANSWER FROM D5]?  
1. Yes  
2. No  
98. (DON’T KNOW)  
99. (REFUSED)

[ASK IF F2 = 2, 98 OR 99 ELSE SKIP TO G1]

F10. How would you have disposed of the unit if the program had not been available? Would you have ...

(PROGRAMMER: LIST SHOULD BE READ IN RANDOM ORDER)  
1. Sold it to a private party such as a friend, family member, or via classified ad [SKIP TO G1]  
2. Sold it to a used appliance dealer [SKIP TO G1]  
3. Given it away for free to a private party such as a friend, family member or on Craig’s list [SKIP TO G1]  
4. Left it on curb with free sign [SKIP TO G1]  
5. Given it away to an organization [SKIP TO G1]  
6. Had it removed by the dealer you got your new or replacement [MEASURE1] from [SKIP TO G1]  
7. Taken it to a dump or recycling center yourself or asked a friend or family member to do it for free [SKIP TO G1]  
8. Hired someone to take it to a dump or recycling center [SKIP TO G1]

F11. [Programmer: If F4= 2 and AGE > 15 or F4 = 5 and AGE>15 or F4 = 7] then read corresponding text below and then ask F6]
[READ IF F4 =2 and AGE > 15]
Used appliance dealers typically only buy units that are less than 15 years old and are in very good condition.

[READ IF F4 =5 and AGE > 15]
Charity organizations only take units that are less than 15 years old and are in good condition

[READ IF F4 =7]
Appliances are heavy and require a truck, trailer, or large vehicle to relocate. Most waste transfer stations do not accept refrigerators and freezers unless the Freon has been drained.

[ASK IF F4 = 2 AND AGE>15 or F4 =5 AND AGE>15 or F4 =7]
F12. Considering this new information, would you have [READ IN ANSWER FROM F4], or would you have done something else?
1. Same thing [SKIP TO G1]
2. Something else
98. Don't know [SKIP TO G1]
99. Refused [SKIP TO G1]

[ASK IF F6 = 2]
F13. What would you have done instead? Would you have ... [READ LIST UNTIL RESPONDENT SAYS “YES” AND RECORD ONE ANSWER] (PROGRAMMER: List should be read in random order)
1. Sold it to a private party such as a friend, family member, or on Craig's list
2. Sold it to a used appliance dealer
3. Given it away for free to a private party such as a friend, family, or via classified ad
4. Left it on curb with free sign
5. Given it away to charity organization
6. Had it removed by the dealer you got your new or replacement [MEASURE1] from
7. Taken it to a dump or recycling center yourself or asked a friend or family member to do it for free
8. Hired someone to take it to a dump or recycling center
9. Kept it

6. **CFL Installation**

G7. Was a free kit containing two CFL light bulbs, refrigerator thermometer, and energy information given to you at the time of pickup? [DO NOT READ]
1. Yes
2. No
98. Don't know
99. Refused
G8. How would you rate the energy information found in this kit? Would you say it was...

1. Very helpful
2. Somewhat helpful
3. Not very helpful
4. Not at all helpful
98. Don’t know
99. Refused

[ASK IF G2<>98 or G2<>99]

G9. Why did you assign this rating? [DO NOT READ LIST. RECORD MULTIPLE]

1. Information too general
2. Already aware of information
3. Information did not apply
4. Written well
5. Other [RECORD VERBATIM]
6. Don’t know
7. Refused

G10. How many of the CFLs that came in the kit did you install?

1. None
2. One
3. Two
98. Don’t know
99. Refused

[ASK IF G4=2 OR G4=3]

G11. What type of bulbs were in the socket before you installed the CFLs? [READ LIST IF NECESSARY]

1. Incandescent (or “traditional” bulbs)
2. CFL
3. LED
4. Halogen
5. Empty
98. Don’t know
99. Refused

[ASK IF G4=1 OR G4=2]

G12. Why didn’t you install [IF G4=1, “them?” IF G4=2, “the other CFL?”] [DO NOT READ LIST. RECORD MULTIPLE]

1. Did not fit fixtures
2. Intend to install later
3. Do not like style
4. Do not like quality
5. Defective product
6. Other [RECORD VERBATIM]
7. Don’t Know
8. Refused

[ASK IF G4=2 OR G4=3]

G13. Where did you install the CFL(s)? [DO NOT READ. RECORD UP TO TWO]
1. Bedroom
2. Bedroom (unoccupied)
3. Basement
4. Bathroom
5. Closet
6. Dining
7. Foyer
8. Garage
9. Hallway
10. Kitchen
11. Office/Den
12. Living Space
13. Storage
14. Outdoor
15. Utility
16. Other [Record verbatim]
98. Don’t Know
99. Refused

G14. Did you install the refrigerator thermometer included in your energy-saving kit? [DO NOT READ]
1. Yes
2. No
98. Don’t Know
99. Refused

[IF G8=1, ASK G9. ELSE, SKIP TO G11]

G15. After installing the thermometer, did you change the temperature setting on your refrigerator? [DO NOT READ]
1. Yes
2. No
98. Don’t Know
99. Refused

[IF G9=1, ASK G10. ELSE, SKIP TO G11]

G16. Did you increase or decrease the temperature setting in your refrigerator?
1. Increase
2. Decrease
G17. Do you remember receiving a booklet in the kit with information about how to save energy? [DO NOT READ]
   1. Yes
   2. No
   98. Don’t Know
   99. Refused

[IF G11=1, ASK G12. ELSE, SKIP TO H1]

G18. Have you followed any of the advice mentioned in the booklet? If so, which ones? [DO NOT READ]
   1. Yes, [RECORD VERBATIM]
   2. No
   98. Don’t Know
   99. Refused

H. Spillover

H7. Since participating in the appliance recycling program, have you participated in any other incentive programs offered by [UTILITY]? [DO NOT READ]
   1. Yes
   2. No
   3. Don’t Know
   4. Refused

[ASK IF H1=1, ELSE SKIP TO H4]

H8. Which programs did you participate in?
   1. [RECORD VERBATIM]
   98. Don’t Know
   99. Refused

H9. How influential was the recycling program in your decision to participate in other [UTILITY] energy efficiency programs? Would you say it was... [READ LIST]
   1. Very influential
   2. Somewhat influential
   3. Not very influential
   4. Not at all influential
   5. Don’t Know
   6. Refused

H10. Based on your experience in recycling your appliance, how likely are you to participate in another utility energy efficiency program? Would you say you are... [READ LIST]
   1. Much more likely
   2. Somewhat more likely
3. No more or less likely
4. Less likely to participate in another program
5. Don’t Know
6. Refused

H11. Besides recycling your old [APPLIANCE TYPE], have you made other energy-efficiency improvements or purchases on your own since participating in the appliance recycling program?
   1. Yes
   2. No
   98. Don’t Know
   99. Refused

[ASK IF H5=1, ELSE SKIP TO I1]

H12. What did you install or purchase? [DO NOT READ. RECORD MULTIPLE]
   1. High-efficiency dishwasher
   2. High-efficiency washing machine
   3. High-efficiency refrigerator
   4. Other [RECORD VERBATIM]
   98. Don’t Know
   99. Refused

H13. Did you receive an incentive for any of those items?
   1. Yes
   2. No
   98. Don’t Know
   99. Refused

H14. How much did your experience with the See Ya Later, Refrigerator Program influence your decision to install other high-efficiency equipment on your own? Would you say it was… [READ LIST]
   1. Very influential
   2. Somewhat influential
   3. Not very influential
   4. Not at all influential
   98. Don’t Know
   99. Refused
I. **Program Satisfaction**

Now we have a few questions about your satisfaction with the See Ya Later, Refrigerator Program.

17. Thinking about the contractor, JACO Environmental, who picked up the appliance(s), how would you rate your satisfaction? [IF RESPONDENT ASKS ABOUT JACO: JACO Environmental is a nationwide See Ya Later, Refrigerator contractor that [UTILITY] has contracted with to administer the See Ya Later, Refrigerator Program.]

Would you say you were.... [READ LIST]

1. Very satisfied,
2. Somewhat satisfied,
3. Not too satisfied, or
4. Not satisfied at all?
5. (DON’T KNOW)
6. (Refused)

[ASK IF I1 = 2, 3 OR 4]

18. Why were you [INSERT RESPONSE FROM I1] with the contractor who picked up the appliance?

1. Other [RECORD VERBATIM]
2. (Don’t know)
3. (Refused)

19. How long did it take to receive the rebate check? Was it: [READ LIST AND RECORD ONE RESPONSE]

1. Less than 4 weeks
2. Between 4 and 6 weeks
3. Between 7 and 8 weeks
4. More than 8 weeks
5. (Have not received the rebate yet)
6. (Don’t know)
7. (Refused)

20. Would you still have participated in the program and recycled your unit if no rebate was given?

1. Yes
2. No
3. (DON’T KNOW)
4. (Refused)

21. How likely would you be to participate if you could give your incentive to [if UT then “Utah Food Bank” OR if WA/WY/ID then “charity”]? 

1. Very likely,
2. Somewhat likely,
3. Not too likely, or
4. Not likely at all?
5. (DON’T KNOW)
6. (Refused)
I12. Thinking about your overall experience with the See Ya Later, Refrigerator program, how would you rate your satisfaction? Would you say you are….[READ LIST]
   1. Very satisfied,
   2. Somewhat satisfied,
   3. Not too satisfied, or
   4. Not satisfied at all?
98. (DON’T KNOW)
99. (Refused)

[ASK IF I6= 2, 3 OR 4]

I13. Why were you [INSERT RESPONSE FROM I6] with the program?
   1. Incentive was too small.
   2. Contractor never called me back.
   3. Contractor showed up late.
   4. Contractor was unreliable/unprofessional.
   5. Difficult to get an appointment time that was convenient for me.
   6. Wanted to use a different [non-program] contractor.
   7. Incentive check took too long to arrive.
   8. Other [RECORD VERBATIM]
98. (Don’t know)
99. (Refused)

[ASK IF I6= 2, 3 OR 4]

I1. What could [UTILITY] do to improve your experience?
   1. [RECORD ANSWER]
98. (DON’T KNOW)
99. (Refused)

I2. Since participating in the See Ya Later, Refrigerator program and receiving your rebate, have you recommended the program to any friends, relatives, or colleagues? [DO NOT READ]
   1. Yes
   2. No
98. (DON’T KNOW)
99. (Refused)

J. Demographics

This section is asked of all residential respondents. Responses are used for segmentation during analysis and to allow [UTILITY] to compare program participants to the general customer population.
These next few questions are for classification purposes only. All information will be kept confidential.

J7. What type of residence do you live in? Is it:
   1. A single-family detached residence
   2. Multifamily apartment or condo building with 4 or more units
   3. Attached house (townhouse, row house, or twin)
   4. Mobile or manufactured house
   5. Something else [SPECIFY:______________]
   98. (DON’T KNOW)
   99. (Refused)

J8. What is the highest level of education that you have completed? [DO NOT READ LIST; RECORD ONE RESPONSE]
   1. (Less than high school diploma or equivalent)
   2. (High school diploma or equivalent)
   3. (Technical or business school certificate/2-year college degree/some college)
   4. (4-year college degree/bachelor’s degree)
   5. (Graduate or professional degree/masters or PhD)
   98. (DON’T KNOW)
   99. (Refused)

J9. Do you rent or own your home?
   1. Own
   2. Rent
   3. Other [RECORD]
   98. (DON’T KNOW)
   99. (Refused)

J10. How long have you lived at that location?
    1. Less than one year
    2. 2-5 years
    3. More than 5 years
    98. (DON’T KNOW)
    99. (Refused)

J11. In what year were you born? [NUMERIC OPEN END; 1890-1999]
    1. [ENTER YEAR]
    99. (Refused)

J12. Including yourself, how many people lived in your home full-time [If Necessary: full-time is considered more than 9 months in the past year] during the past 12 months? [NOTE TO INTERVIEWER, if respondent says 0 or “just me”, etc., please record “1”]
    1. 1
    2. 2
    3. 3
K. COMMENTS

This question will gather additional information that the respondent has not mentioned during the rest of the survey.

K7. Thank you for your time in answering all my questions. Do you have any comments or additional feedback about [UTILITY]’s [PROGRAM] program? [IF OTHER COMMENTS MENTIONED DURING SURVEY ALSO SAY, “Earlier you mentioned ….Can you tell me about that so that I can capture all the details?”]

(Select one) [PHONE: DO NOT READ LIST]

1. [RECORD COMMENTS]
2. (Notes entered but no additional comments or details)
3. (No comments in this question or additional comments previously in survey)
98. (DON’T KNOW)
99. (Refused)

[ASK IF K1=1 or 2]

K8. Would you like us to pass this information along to [UTILITY] so that they can follow-up with you?

1. (Yes)
2. (No)
98. (Don’t know)
99. (Refused)

[ASK IF K2=1]

K9. So that we have the most accurate information, can I have your name?

1. [RECORD NAME]
98. (Don’t know)
99. (Refused)

[ASK IF K2=1]
K10. Is the number [INSERT PHONE NUMBER] the best phone number for [UTILITY] to reach you?
   1. (Yes)
   2. (No) [RECORD CORRECT NUMBER]
   98. (Don’t know)
   99. (Refused)

L. **Closing**

Thank you for taking the time to respond to our survey. Have a nice day/evening.
### Appendix D. Logic Model

#### Table 35. See Ya Later, Refrigerator Program Logic Model Links: Working Hypotheses and Indicators

<table>
<thead>

Appendix E. Refrigerator NTG Combined Decision Tree
Appendix F. Freezer NTG Combined Decision Tree

Per-unit savings net of free敬畏 and secondary market impacts = 335

INDUCED kWh: Induced Consumption = 110

Per-unit savings = 335 - 110 + 9 = 234 → 234 / 90 = 0.26
Appendix G. CFL Engineering Calculations and Assumptions

**HOU**

Cadmus estimated CFL HOU using a multistate modeling approach, built on light logger data collected from two states: Missouri and Maryland. Both of these states were included in the 2011–2012 analysis and have had subsequent, recent studies.

**Metering Protocol**

Following whole-house lighting audits, Cadmus installed up to 10 light meters on randomly selected lighting fixture groups, targeting incandescents, CFLs, and medium screw-based LEDs. To ensure unbiased installations, Cadmus used an iPad tool to randomly select fixtures receiving the meters. The iPad tool assigned meter installations based on room priorities, with the first five meters assigned to each of five priority room types (e.g., living area, dining room, kitchen, master bedroom, bathroom). The remaining five meters were randomly assigned to any fixture in any non-priority room (e.g., secondary bedrooms, closet, hall, basement, office, laundry, mechanical). Randomly assigning meters in this manner sought to improve precision around priority rooms (where most lamps were installed).

Data from the removal site visits were incorporated into the iPad tool and database to augment the installation information for each site and meter. As part of the lighting logger removal process, technicians conducted a series of pre-removal meter diagnostics, including the following:

- Completing a logger state test (which determined if the meter functioned properly and whether ambient light affected the meter’s operation);
- A visual review of the total time that the logger recorded the fixture being on;
- Verbal verification from the customer that they used the light fixture;
- Verbal verification from the customer that the logger remained in place for the study’s duration; and
- Recording the condition of the logger and battery status.

**Model Specification**

To estimate HOU, Cadmus determined the total “on” time for each individual light logger per day, using the following guidelines:

- If a light logger did not record any light for an entire day, the day’s HOU was set to zero.
- If a light logger registered a light turned on at 8:30 p.m. on Monday and turned off at 1:30 a.m. on Tuesday morning, 3.5 hours were added to Monday’s HOU and 1.5 hours to Tuesday’s HOU.

Cadmus modeled daily HOU as a function of room type using an analysis of covariance (ANCOVA) model. ANCOVA models are regression models, which model a continuous variable as a function of a single, continuous explanatory variable (in this case, CFL saturation) and a set of binary variables. This way, an ANCOVA model simply serves as an analysis of variance (ANOVA) model with a continuous explanatory
variable added. Cadmus chose this specification due to its simplicity, making it suitable in a wide variety of contexts. Though the model lacks the specificity of other methods, it offers estimates not nearly as sensitive to small differences in explanatory variables, compared to more complex methods. Therefore, these models can produce consistent estimates of average daily HOU for a given region, using its specific distribution of bulbs by room and household type.

Cadmus specified final models as cross-sectional, ANCOVA regressions:

\[
\text{Average Daily HOU} = \beta_1 \ast \text{Basement} + \beta_2 \ast \text{Bathroom} + \beta_3 \ast \text{Bedroom} + \beta_4 \ast \text{Closet} + \beta_5 \ast \text{Dining} + \beta_6 \ast \text{Foyer} + \beta_7 \ast \text{Garage} + \beta_8 \ast \text{Hallway} + \beta_9 \ast \text{Kitchen} + \beta_{10} \ast \text{Living Space} + \beta_{11} \\
\ast \text{Office} + \beta_{12} \ast \text{Outdoor} + \beta_{13} \ast \text{Storage} + \beta_{14} \ast \text{Utility} + \beta_{15} \ast \text{Other} + \beta_{16} \ast \text{SinHOU}
\]

Where:

- \text{Basement} = \text{a dummy variable equal to one, if the bulb is in the basement, and zero otherwise;}
- \text{Bathroom} = \text{a dummy variable equal to one, if the bulb is in the bathroom, and zero otherwise;}
- \text{Bedroom} = \text{a dummy variable equal to one, if the bulb is in a bedroom, and zero otherwise;}
- \text{Closet} = \text{a dummy variable equal to one, if the bulb is in the closet, and zero otherwise;}
- \text{Dining} = \text{a dummy variable equal to one, if the bulb is in the dining room, and zero otherwise;}
- \text{Foyer} = \text{a dummy variable equal to one, if the bulb is in the foyer, and zero otherwise;}
- \text{Garage} = \text{a dummy variable equal to one, if the bulb is in the garage, and zero otherwise;}
- \text{Hallway} = \text{a dummy variable equal to one, if the bulb is in the hallway, and zero otherwise;}
- \text{Kitchen} = \text{a dummy variable equal to one, if the bulb is in the kitchen, and zero otherwise;}
- \text{Living Space} = \text{a dummy variable equal to one, if the bulb is in the living space, and zero otherwise;}
- \text{Office} = \text{a dummy variable equal to one, if the bulb is in an office, and zero otherwise;}
- \text{Outdoor} = \text{a dummy variable equal to one, if the bulb is outdoors, and zero otherwise;}
- \text{Storage} = \text{a dummy variable equal to one, if the bulb is in a storage room, and zero otherwise;}
- \text{Utility} = \text{a dummy variable equal to one, if the bulb is in the utility room, and zero otherwise;}
- \text{Other} = \text{a dummy variable equals to one, if the bulb is in a low-use room (such as a utility room, laundry room, or closet), and zero otherwise; and}
- \text{SinHOU} = \text{amplitude of sinusoid function.}

As not all loggers collected a full year of data, Cadmus estimated an annual average HOU for all lamps, fitting the data to a sinusoidal curve that represented changes in hours of available daylight per day.\(^{31}\)

\(^{31}\) Page 15 of the UMP for lighting impact evaluations recommends using the sinusoidal annualization approach due to the strong relationship between daylight hours and lighting usage observed in a large number of studies. Available online at: [http://www1.eere.energy.gov/wip/pdfs/53827-6.pdf](http://www1.eere.energy.gov/wip/pdfs/53827-6.pdf)
Cadmus tested the potential influences of other demographic and day type variables in model specifications (e.g., home characteristics, weekend/weekday). These variables, however, were not included as their estimated coefficients did not differ significantly from zero or they produced signs inconsistent with expectations.

</table>

Cadmus used these model parameters to predict average daily use for SYLR by taking the sum of the product of each coefficient shown in Table 36, and its corresponding average independent variable. The independent variables were calculated based on which rooms the survey participants reported installing bulbs included in the energy-savings kits.

Table 37 shows independent variables used for SYLR.

The survey responses indicated changes in the proportion of bulbs installed in various rooms between the 2011–2012 cycle and the current evaluation. The share of bulbs installed in living spaces (which had a higher average usage) dropped from 28% in 2011–2012 to 17%.

Conversely, the share of bulbs installed into room types designated as “other” in the 2011–2012 cycle (e.g., utility rooms, closets, hallways) increased from 19% in 2011–2012 to 27% in the current evaluation. These room types tended to have a lower average HOU.

Using these values, the equation calculated a 1.80 average daily HOU.

**Waste Heat Factor**

The waste heat factor (WHF) is an adjustment representing the interactive effects of lighting measures on heating and cooling equipment operation. For this evaluation, Cadmus used Simplified Energy Enthalpy Model (SEEM) modeling results from the most recent version of the Regional Technical Forum’s (RTF) residential CFL and LED savings workbook as the foundation for WHF analysis.

Table 38 and Table 39 show the RTF SEEM results and evaluation weightings. The saturation weightings for heating and cooling were based on results from the 2013–2014 phone survey. The cooling zone weightings were based on typical meteorological year 3 (TMY3) weather data and census population data for Idaho counties.

</tbody>
</table>

---

32 SEEM is a building simulation model that stands for Simplified Energy Enthalpy Model. The RTF calibrated the SEEM model for residential homes to provide the magnitude of interaction between the lighting and HVAC systems. Additional background information for SEEM may be found here: http://rtf.nwcouncil.org/measures/support/seem/

</tbody>
</table>

Calculating the weighted averages of the values in Table 38 and Table 39 gave the average impacts due to heating and cooling, shown in Table 40. Adding heating and cooling impacts produced a combined impact of -0.09 kWh/kWh saved.
<table>
<thead>
<tr>

<tr>
<td>Combined</td>
<td>-0.090</td>
</tr>
</tbody>
</table>

Lastly, Cadmus considered the location of bulbs to determine the appropriate WHF for all bulbs as not all bulbs would be installed in conditioned spaces. Cadmus applied bulb allocations by space type from the phone survey data to the thermal coupling factors from the RTF in Table 41.

<table>
<thead>
<tr>
<th>Space Type</th>
<th>RTF Thermal Coupling Correction Factor</th>
